*Numerical Methods for Black-Box Software in Computational Continuum Mechanics* Sergey I. Martynenko, 2023-10-24

The organization of the material is presented as follows This introductory chapter I represents a theoretical analysis of the computational algorithms for a numerical solution of the basic equations in continuum mechanics In this chapter the general requirements for computational grids discretization and iterative methods for black box software are examined Finally a concept of a two grid algorithm for de coupled solving multidimensional non linear initial boundary value problems in continuum mechanics multiphysics simulation in complex domains is presented Chapter II contains descriptions of the sequential Robust Multigrid Technique which is developed as a general purpose solver in black box codes This chapter presents the main components of the Robust Multigrid Technique RMT used in the two grid algorithm Chapter I to compute the auxiliary structured grid correction This includes the generation of multigrid structures computation of index mapping and integral evaluation Finite volume discretization on the multigrid structures will be explained by studying a 1D linear model problem In addition the algorithmic complexity of RMT and black box optimization of the problem dependent components of RMT are analysed Chapter III provides a description of parallel RMT This chapter introduces parallel RMT based algorithms for solving the boundary value problems and initial boundary value problems in unified manner Section 1 presents a comparative analysis of the parallel RMT and the sequential V cycle Sections 2 and 3 present a geometric and an algebraic parallelism of RMT i e parallelization of the smoothing iterations on the coarse and the levels A parallel multigrid cycle will be considered in Section 4 A parallel RMT for the time dependent problems is given in Section 5 Finally the basic properties of parallel RMT will be summarized in Section 6 Theoretical aspects of the used algorithms for solving multidimensional problems are discussed in Chapters IV This chapter contains the theoretical aspects of the algorithms used for the numerical solving of the resulting system of linear algebraic equations obtained from discrete multidimensional initial boundary value problems     Energy Research Abstracts ,1988     Tragediia sovetskoï derevni ,1999     *Energy-Momentum Conservation Laws* Emil Zolotoyabko, 2024-01-29 Conservation laws reflecting the symmetry of space and time play a vital role in understanding the surrounding world Conservation laws allow us to explain very different phenomena from a unified point of view The textbook illustrates this principle taking examples from mechanics optics nuclear physics solid state physics and medicine They include for example positron annihilation used in experiments aimed at neutrino registration and in the positron emission tomography for patient diagnostics the functioning of solar cells infrared detectors and light emitting diodes LEDs slowing down fission neutrons toward achieving a nuclear chain reaction jet propulsion of a rocket and an octopus principles of magnetic resonance imaging and principles standing behind fission and fusion nuclear reactions and more
