Medical Sciences (CIOMS), 2020-06-15 Drug induced liver injury DILI is a growing challenge because of the ever increasing number of drugs used in medical care DILI is rare but can be serious and is largely unpredictable It is an important cause of mortality and liver transplantation and a leading cause of attrition in drug development Progress is under way in identifying genetic risk factors exploring new mechanistic concepts of the complex underlying interactions and developing new biomarkers that can predict or diagnose DILI The pharmaceutical industry has a key role in advancing these initiatives and prospective DILI registries must adopt standard procedures for biological sample collection and storing There is a strong need for standard guidelines to support these efforts The consensus report of the CIOMS DILI Working Group aims to provide a critical framework and essential set of tools to detect diagnose and manage DILI during drug development and in

the post marketing setting The report is intended for clinical and basic pharmaceutical industry investigators who capture analyze and communicate liver safety data in drug development It is also intended for regulatory scientists and expert consultants who comprehensively evaluate new products and emerging biomarkers for their association with DILI risk and for health care professionals who monitor and manage patients treated with potentially hepatotoxic drugs in clinical practice
