

THE STRUCTURE OF KOSZUL ALGEBRAS DEFINED BY FOUR QUADRICS

PAOLO MANTERO AND MATTHEW MASTROENI

ABSTRACT. Avramov, Conca, and Iyengar ask whether $\beta_i^S(R) \leq \binom{g}{i}$ for all i when $R = S/I$ is a Koszul algebra minimally defined by g quadrics. In recent work, we give an affirmative answer to this question when $g \leq 4$ by completely classifying the possible Betti tables of Koszul algebras defined by height-two ideals of four quadrics. Continuing this work, the current paper proves a structure theorem for Koszul algebras defined by four quadrics. We show that all these Koszul algebras are LG-quadratic, proving that an example of Conca of a Koszul algebra that is not LG-quadratic is minimal in terms of number of defining equations. We then characterize precisely when these rings are absolutely Koszul, and establish the equivalence of the absolutely Koszul and Backelin–Roos properties up to field extensions for such rings (in characteristic zero). The combination of the above paper with the current one provides a fairly complete picture of all Koszul algebras defined by $g \leq 4$ quadrics.

1. INTRODUCTION

A graded ideal I in a standard graded polynomial ring S over a field k defines a *Koszul algebra* $R = S/I$ if $k \cong R/R_+$ has a linear free resolution over R . This extraordinary homological condition leads to numerous other restrictions on the Hilbert series and Betti numbers of R over S ; see [Fro99] and [Con14]. In particular, a question of Avramov, Conca, and Iyengar asks:

Question 1.1 ([AC10, 6.5]). If R is Koszul and I is minimally generated by g quadrics, does the following inequality hold for all i ?

$$\beta_i^S(R) \leq \binom{g}{i}$$

In particular, is $\text{pd}_S R \leq g$?

This question is known to have an affirmative answer when R is LG-quadratic. We say that R or I is *G-quadratic* if, after a suitable linear change of coordinates $\varphi : S \rightarrow S$, the ideal $\varphi(I)$ has a Gröbner basis consisting of quadrics. We also say that R or I is *LG-quadratic* if R is a quotient of a G-quadratic algebra A by an A -sequence of linear forms. Every G-quadratic algebra is Koszul by upper semicontinuity of the Betti numbers; see [BC03, 3.13]. Since deforming by a regular sequence of linear forms preserves Koszulness (see Proposition 2.1), every LG-quadratic algebra is also Koszul.

Dualities On Generalized Koszul Algebras:

Dualities on Generalized Koszul Algebras Edward L. Green, Idun Reiten, Øyvind Solberg, 2002 Koszul rings are graded rings which have played an important role in algebraic topology noncommutative algebraic geometry and in the theory of quantum groups One aspect of the theory is to compare the module theory for a Koszul ring and its Koszul dual There are dualities between subcategories of graded modules the Koszul modules Classification and Probabilistic Representation of the Positive Solutions of a Semilinear Elliptic Equation Benoît Mselati, 2004 Concerned with the nonnegative solutions of $\Delta u = u^2$ in a bounded and smooth domain in \mathbb{R}^d this title intends to prove that they are uniquely determined by their fine trace on the boundary as defined in DK98a answering a major open question of Dy02 **Connectivity Properties of Group Actions on Non-Positively Curved Spaces** Robert Bieri, Ross Geoghegan, 2003 Generalizing the Bieri Neumann Strebel Renz Invariants this Memoir presents the foundations of a theory of not necessarily discrete actions ρ of a suitable group G by isometries on a proper CAT 0 space M The passage from groups G to group actions ρ implies the introduction of Sigma invariants $\Sigma_k \rho$ to replace the previous $\Sigma_k G$ introduced by those authors Their theory is now seen as a special case of what is studied here so that readers seeking a detailed treatment of their theory will find it included here as a special case We define and study controlled k connectedness CC_k of ρ both over M and over end points e in the boundary at infinity ∂M $\Sigma_k \rho$ is by definition the set of all e over which the action is $k+1$ connected A central theorem the Boundary Criterion says that $\Sigma_k \rho = \partial M$ if and only if ρ is CC_{k+1} over M An Openness Theorem says that CC_k over M is an open condition on the space of isometric actions ρ of G on M Another Openness Theorem says that $\Sigma_k \rho$ is an open subset of ∂M with respect to the Tits metric topology When ρ of G is a discrete group of isometries the property CC_{k+1} is equivalent to $\ker \rho$ having the topological finiteness property type F_k More generally if the orbits of the action are discrete CC_{k+1} is equivalent to the point stabilizers having type F_k In particular for $k=2$ we are characterizing finite presentability of kernels and stabilizers Examples discussed include locally rigid actions translation actions on vector spaces especially those by metabelian groups **Descriptive Set Theory and Definable Forcing** Jindřich Zapletal, 2004 Focuses on the relationship between definable forcing and descriptive set theory the forcing serves as a tool for proving independence of inequalities between cardinal invariants of the continuum **Algebras and Modules II** Idun Reiten, Sverre O.
