A Handbook of Tropical Soil Biology Fatima M. S. Moreira, E. Jeroen Huising, David E. Bignell, 2012-05-04 This practical handbook describes sampling and laboratory assessment methods for the biodiversity of a number of key functional groups of soil organisms including insects earthworms nematodes fungi and bacteria The methods have been assembled and the protocols drafted by a number of scientists associated with the UNEP GEF funded Conservation and Sustainable Management of Below Ground Biodiversity Project executed by the Tropical Soil Biology and Fertility TSBF Institute of the International Center for Tropical Agriculture CIAT The methods provide a standardized basis for characterizing soil biodiversity and current land uses in terrestrial natural semi natural and agroecosystems in tropical forests and at forest margins The aim is to assess soil biodiversity against current and historic land use practices both at plot and landscape scales and further to identify opportunities for improved sustainable land management through the introduction management or remediation of soil biota thus reducing the need for external inputs such as fertilizers and pesticides The book also contains extensive advice on the handling of specimens and the allocation of organisms to strain or functional group type Published with TSBF CIAT CTA UNEP and GEF

Natural Toxins 2 Bal Ram Singh, Anthony T. Tu, 2012-12-06 From beach encounters aquaculture perils and processed food poisoning to snake bites and biological warfare natural toxins seem never to be far from the public's sight A better understanding of toxins in terms of their origin structure function relationships mechanism of action and detection and diagnosis is of utmost importance to human and animal food safety nutrition and health In addition it is now clear that many of the toxins can be used as scientific tools to explore the molecular mechanism of several biological processes be it a mechanism involved in the function of membrane channels exocytosis or cytotoxicity Several of the natural toxins have also been approved as therapeutic drugs which has made them of interest to several pharmaceutical companies For example botulinum neurotoxins which have been used in studies in the field of neurobiology have also been used directly as therapeutic drugs against several neuromuscular diseases such as strabismus and blepharospasm Toxins in combination with modern biotechnological approaches are also being investigated for their potential use against certain deadly medical problems For example a combination of plant toxin ricin and antibodies is being developed for the treatment of tumors The great potential of natural toxins has attracted scientists of varying backgrounds pure chemists to cancer biologists to the study of fundamental aspects of the actions of these toxins

New Advances and Contributions to Forestry Research Dr. Andrew A. Oteng-Amoako, 2012-04-27 New Advances and Contributions to Forestry Research consists of 14 chapters divided into three sections and is authored by 48 researchers from 16 countries and all five continents Section Whither the Use of Forest Resources authored by 16 researchers describes negative and positive practices in forestry Forest is a complex habitat for man animals insects and micro organisms and their activities may impact positively or negatively on the forest This complex relationship is explained in the section Forest and Organisms Interactions

consisting of contributions made by six researchers Development of tree plantations has been man's response to forest degradation and deforestation caused by human animals and natural disasters Plantations of beech spruce Eucalyptus and other species are described in the last section Amelioration of Dwindling Forest Resources Through Plantation Development a section consisting of five papers authored by 20 researchers New Advances and Contributions to Forestry Research will appeal to forest scientists researchers and allied professionals It will be of interest to those who care about forest and who subscribe to the adage that the last tree dies with the last man on our planet I recommend it to you enjoy reading it save the forest and save life

The Real Cost of Cheap Food Michael Carolan, 2013-10-30 This challenging but accessible book critically examines the dominant food regime on its own terms by seriously asking whether we can afford cheap food and exploring what exactly cheap food affords us Detailing the numerous ways that food has become reduced to a state such as a price per ounce combination of nutrients yield per acre or calories the book argues for a more contextual understanding of food when debating its affordability The author makes a compelling case for why today's global food system produces just the opposite of what it promises The food produced under this regime is in fact exceedingly expensive Thus meat production and consumption are inefficient uses of resources and contribute to climate change the use of pesticides in industrial scale agriculture may produce cheap food but there are hidden costs to environmental protection human health and biodiversity conservation Many of these costs will be paid for by future generations cheap food today may mean expensive food tomorrow By systematically assessing these costs the book delves into issues related but not limited to international development national security health care industrial meat production organic farming corporate responsibility government subsidies food aid and global commodity markets The book concludes by suggesting ways forward going beyond the usual solutions such as farmers markets community supported agriculture and community gardens Exploding the myth of cheap food requires we have at our disposal a host of practices and policies Some of those proposed and explored include microloans subsidies for consumers vertical agriculture and the democratization of subsidies for producers

Forest Ecosystems Juan A. Blanco, Yueh-Hsin Lo, 2012-03-07 The common idea for many people is that forests are just a collection of trees However they are much more than that They are a complex functional system of interacting and often interdependent biological physical and chemical components the biological part of which has evolved to perpetuate itself This complexity produces combinations of climate soils trees and plant species unique to each site resulting in hundreds of different forest types around the world Logically trees are an important component for the research in forest ecosystems but the wide variety of other life forms and abiotic components in most forests means that other elements such as wildlife or soil nutrients should also be the focal point in ecological studies and management plans to be carried out in forest ecosystems In

this book the readers can find the latest research related to forest ecosystems but with a different twist The research described here is not just on trees and is focused on the other components structures and functions that are usually overshadowed by the focus on trees but are equally important to maintain the diversity function and services provided by forests The first section of this book explores the structure and biodiversity of forest ecosystems whereas the second section reviews the research done on ecosystem structure and functioning The third and last section explores the issues related to forest management as an ecosystem level activity all of them from the perspective of the other parts of a forest

Spatial Temporal Patterns for Action-Oriented Perception in Roving Robots Paolo Arena, Luca Patanè, 2008-12-19 The basic principles guiding sensing perception and action in bio systems seem to rely on highly organised spatial temporal dynamics In fact all biological senses visual hearing tactile etc process signals coming from different parts distributed in space and also show a complex time evolution As an example mammalian retina performs a parallel representation of the visual world embodied into layers each of which represents a particular detail of the scene These results clearly state that visual perception starts at the level of the retina and is not related uniquely to the higher brain centres Although vision remains the most useful sense guiding usual actions the other senses rest of all hearing but also touch become essential particularly in cluttered conditions where visual percepts are somehow obscured by environment conditions Efficient use of hearing can be learnt from acoustic perception in animals insects like crickets that use this ancient sense more than all the others to perform a vital function like mating
