Black Holes And Supernovae:

The Mysterious Universe Ellen Jackson, 2008 The universe is rapidly expanding Of that much scientists are certain But how fast And with what implications regarding the fate of the universe Ellen Jackson and Nic Bishop follow Dr Alex Filippenko and his High Z Supernova Search Team to Mauna Kea volcano in Hawaii where they will study space phenomena and look for supernovae dying stars that explode with the power of billions of hydrogen bombs Dr Filippenko looks for black holes areas in space with such a strong gravitational pull that no matter or energy can escape from them with his robotic telescope And they study the effects of dark energy the mysterious force that scientists believe is pushing the universe apart causing its constant and accelerating expansion *Black Holes and Supernovas* Joan Marie Galat, 2011-06 Describes supernovas and black holes including what they are how they form and how scientists research them **Black Holes and Supernovae** David E. Newton, 1997-01 Describes the nature and formation of black holes and how they affect matter around them **Supernovae** Paul Murdin, Lesley Murdin, 1985-11-07 This revised 1985 edition tells the story of supernovae capturing the flavour of ancient astronomy Supernovae and Gamma-Ray Bursts Mario Livio, Nino Panagia, Kailash Sahu, 2001-07-02 Since the dramatic discovery that the supernova SN1998bw coincided in position and time with a gamma ray burst the possibility was raised that these two types of spectacular explosions are related This timely volume presents especially written articles by a host of world experts who gathered together for an international conference at the Space Telescope Science Institute This was the first meeting in which the communities of supernova researchers and gamma ray burst researchers were brought together to share ideas The contributions review the mechanisms for these explosive events the possible connections between them and their relevance for cosmology Both observations and theoretical developments are covered This book is an invaluable source of information for both active researchers and graduate students in this exciting area of research **Formation And Evolution Of Black Holes In The Galaxy: Selected Papers With Commentary** Hans A Bethe, Gerald E Brown, Chang-hwan Lee, 2003-03-04 In published papers H A Bethe and G E Brown worked out the collapse of large stars and supernova explosions They went on to evolve binaries of compact stars finding that in the standard scenario the first formed neutron star always went into a black hole in common envelope evolution C H Lee joined them in the study of black hole binaries and gamma ray bursts They found the black holes to be the fossils of the gamma ray bursts From their properties they could reconstruct features of the burst and of the accompanying hypernova explosions This invaluable book contains 23 papers on astrophysics chiefly on compact objects written over 23 years The papers are accompanied by illuminating commentary In addition there is an appendix on kaon condensation which the editors believe to be relevant to the equation of state in neutron stars and to explain why black holes are formed at relatively low masses From Twilight to Highlight: The Physics of Supernovae W. Hillebrandt (Ed), 2003-02-27 Supernovae their bearing on cosmology and their connection to gamma ray bursts are now at the center of astrophysical research programs

This volume deals with astronomical observations of supernovae and their relation to nuclear and particle astrophysics. All known aspects of supernovae explosions are investigated in articles specifically written for researchers and advanced graduate students. It also includes recent numerical experiments related to the question of hydrodynamical instability in two and three dimensions and to problems concerning the complexity of radiation transport in the models. Other contributions discuss the possible energy sources needed to drive these powerful stellar explosions.

Physics and Evolution of Supernova Remnants Jacco Vink, 2020-11-10

Written by a leading expert, this monograph presents recent developments on supernova remnants with the inclusion of results from various satellites and ground based instruments. The book details the physics and evolution of supernova remnants as well as provides an up to date account of recent multiwavelength results. Supernova remnants provide vital clues about the actual supernova explosions from X ray spectroscopy of the supernova material or from the imprints the progenitors had on the ambient medium. Supernova remnants are interacting with all of which the author discusses in great detail. The way in which supernova remnants are classified is reviewed and explained early on. A chapter is devoted to the related topic of pulsar wind nebulae and neutron stars associated with supernova remnants. The book also includes an extended part on radiative processes, collisionless shock physics and cosmic ray acceleration, making this book applicable to a wide variety of astronomical sub disciplines. With its coverage of fundamental physics and careful review of the state of the field, the book serves as both textbook for advanced students and as reference for researchers in the field.

The Supernova Story Laurence A. Marschall, 2021-02-09

Astronomers believe that a supernova is a massive explosion signaling the death of a star, causing a cosmic recycling of the chemical elements and leaving behind a pulsar, black hole or nothing at all. In an engaging story of the life cycles of stars, Laurence Marschall tells how early astronomers identified supernovae and how later scientists came to their current understanding, piecing together observations and historical accounts to form a theory which was tested by intensive study of SN 1987A, the brightest supernova since 1006. He has revised and updated *The Supernova Story* to include all the latest developments concerning SN 1987A, which astronomers still watch for possible aftershocks, as well as SN 1993J, the spectacular new event in the cosmic laboratory.

Supernovae, Neutron Star Physics and Nucleosynthesis Debades Bandyopadhyay, Kamales Kar, 2022-03-28

This book deals with the interdisciplinary areas of nuclear physics, supernovae and neutron star physics. It addresses the physics and astrophysics of the spectacular supernova explosions, starting with the collapse of massive stars and ending with the birth of neutron stars or black holes. Recent progress in the understanding of core collapse supernova (CCSN) and observational aspects of future detections of neutrinos from CCSN explosions are discussed. The other main focus in this text is the novel phases of dense nuclear matter, its compositions and equation of state (EoS) from low to very high baryon density, relevant to supernovae and neutron stars. The multi messenger astrophysics of binary neutron star merger GW170817 and its relation to EoS through tidal deformability are also presented in detail. The synthesis of elements heavier than iron in the

supernova and neutron star environment by the rapid r process are treated here with special emphasis on the nucleosynthesis in the ejected material from GW170817 This monograph is written for graduate students and researchers in the field of nuclear astrophysics
