**Nonlinear Digital Filters** Ioannis Pitas, Anastasios N. Venetsanopoulos, 2013-03-14 The function of a filter is to transform a signal into another one more suitable for a given purpose As such filters find applications in telecommunications radar sonar remote sensing geophysical signal processing image processing and computer vision Numerous authors have considered deterministic and statistical approaches for the study of passive active digital multidimensional and adaptive filters Most of the filters considered were linear although the theory of nonlinear filters is developing rapidly as it is evident by the numerous research papers and a few specialized monographs now available Our research interests in this area created opportunity for cooperation and coauthored publications during the past few years in many nonlinear filter families described in this book As a result of this cooperation and a visit from John Pitas on a research leave at the University of Toronto in September 1988 the idea for this book was first conceived The difficulty in writing such a monograph was that the area seemed fragmented and no general theory was available to encompass the many different kinds of filters presented in the literature However the similarities of some families of nonlinear filters and the need for such a monograph providing a broad overview of the whole area made the project worthwhile The result is the book now in your hands typeset at the Department of Electrical Engineering of the University of Toronto during the summer of 1989

### **Information Loss in Deterministic Signal Processing Systems**

Bernhard C. Geiger, Gernot Kubin, 2017-07-02 This book introduces readers to essential tools for the measurement and analysis of information loss in signal processing systems Employing a new information theoretic systems theory the book analyzes various systems in the signal processing engineer's toolbox polynomials quantizers rectifiers linear filters with and without quantization effects principal components analysis multirate systems etc The user benefit of signal processing is further highlighted with the concept of relevant information loss Signal or data processing operates on the physical representation of information so that users can easily access and extract that information However a fundamental theorem in information theory data processing inequality states that deterministic processing always involves information loss These measures form the basis of a new information theoretic systems theory which complements the currently prevailing approaches based on second order statistics such as the mean squared error or error energy This theory not only provides a deeper understanding but also extends the design space for the applied engineer with a wide range of methods rooted in information theory adding to existing methods based on energy or quadratic representations
