

planned to major in the sciences had higher scores on the quantitative portion of the SAT than students planning to major in other fields.

Astin (1982:106) reported that minority students in the natural sciences and engineering received lower grades than would be expected from their academic background characteristics, while minority students majoring in the arts, humanities, social sciences, or education received higher grades. Low grades in college courses may "push" many students out of the science curriculum.

When it comes to training for the quantitative fields, there are large differences in the preparation of minority and nonminority students. Among the 1983 college freshmen with probable majors in mathematics, 80.2 percent of the white students had 4 or more years of high school mathematics. Only 60.8 percent of the blacks and 57.5 percent of the Native Americans planning college majors in mathematics had four or more years of high school mathematics (NSF, 1986:154). There were also large disparities in mathematics preparation among the physical science majors.

Dunteman, et al., (1979:102) demonstrated the importance of these background differences in the choice of college major. When racial groups were statistically equated on four key intervening variables (mathematics ability, orientation to things, perception of mothers' educational aspiration for children, and number of high school science semesters), there was a substantial positive effect of being black on the choice of science majors. The intervening factors accounted for the negative relationship between being black and being a science major.

Most of the research and commentary on precollege factors has focused on academic background. However, researchers have also reported an important relationship between socioeconomic background and the choice of a science major in college. Dunteman, et al., (1979:102) found differences between the socioeconomic status of the families of science majors and other majors. Berryman (1983:89-93) found that having a college-educated parent not only increased the likelihood of choosing a quantitative major, but equalized the rate of choice across white, black, American Indian, and Hispanic subgroups. At least part of the relationship between parental education and college major was due to the effects of parental education on students' high school performance and postsecondary education plans. Berryman hypothesized that parents with college experience were more likely to assume that their children would attend college and also knew more about the early training investments that their children needed to make. She also postulated that the second-generation college students were more likely to have grown up with knowledge of wider occupational horizons than first-generation college students.

Mentors and Minority Participation in Science and Engineering Curricula. Several studies have stressed the importance of role models for increasing the number of minority scientists and professionals (Murphy and McNair, 1981; National Research Council, 1977:21-22; New York State, 1984:4; Office of Technology Assessment, 1985:141). Minority science students have acknowledged the importance of mentors and role
