The Living Animals of the World: Mammals Charles John Cornish, Frederick Courteney Selous, Harry Johnston, Sir Herbert Maxwell, 1902 *Mammals of America* Harold Elmer Anthony, 1917 **Animals of the World** Joseph Walker McSpadden, 1952 Mammals of the Eastern United States John O. Whitaker, William John Hamilton, 1998 In Their

Definitive Work on eastern mammals John O Whitaker Jr and William J Hamilton Jr vividly convey their sheer delight at the variety and abundance of mammalian life They have brought together a wealth of biological information and applied a biological subspecies concept to the mammals of the eastern United States *Bibliography Series*, 1970 **Stochastic Population Dynamics in Ecology and Conservation** Russell Lande, Steinar Engen, Bernt-Erik Sæther, 2003 All populations fluctuate stochastically creating a risk of extinction that does not exist in deterministic models with fundamental consequences for both pure and applied ecology This book provides the most comprehensive introduction to stochastic population dynamics combining classical background material with a variety of modern approaches including new and previously unpublished results by the authors illustrated with examples from bird and mammal populations and insect communities Demographic and environmental stochasticity are introduced with statistical methods for estimating them from field data The long run growth rate of a population is explained and extended to include age structure with both demographic and environmental stochasticity Diffusion approximations facilitate the analysis of extinction dynamics and the duration of the final decline Methods are developed for estimating delayed density dependence from population time series using life history data Metapopulation viability and the spatial scale of population fluctuations and extinction risk are analyzed Stochastic dynamics and statistical uncertainty in population parameters are incorporated in Population Viability Analysis and strategies for sustainable harvesting Statistics of species diversity measures and species abundance distributions are described with implications for rapid assessments of biodiversity and methods are developed for partitioning species diversity into additive components Analysis of the stochastic dynamics of a tropical butterfly community in space and time indicates that most of the variance in the species abundance distribution is due to ecological heterogeneity among species so that real communities are far from neutral Latin American Mammalogy Michael A. Mares, David J. Schmidly, 1991 In this volume thirty six scientists from Latin American and the United States contribute substantially to our knowledge of Latin

American mammals Part 1 provides a history of the pioneers in collection based mammalogy which began only about two centuries ago Chapters in Part 2 demonstrate the search for theories and methodologies that will help us understand how the fauna of this region came to be Part 3 addresses conservation policy and management in light of recent enormous changes in the natural habitats of Latin America Part 4 explores the need for conservation education programs in Latin America as a critical step in the development of a sound land use ethic The preface of Latin American Mammalogy overviews of the four sections and summaries of the twenty three chapters are given in Spanish as well as English

Arctic and Alpine Biodiversity: Patterns, Causes and Ecosystem Consequences F.Stuart III Chapin,Christian Körner,2013-03-08 As human populations expand and have increasing access to technology two general environmental concerns have arisen First human populations are having increasing impact on the earth system such that we are altering the biospheric carbon pools basic processes of elemental cycling and the climate system of the earth Because of time lags and feedbacks these processes are not easily reversed These alterations are occurring now more rapidly than at any time in the last several million years Secondly human activities are causing changes in the earth s biota that lead to species extinctions at a rate and magnitude rivaling those of past geologic extinction events Although environmental change is potentially reversible at some time scales the loss of species is irrevocable Changes in diversity at other scales are also cause for concern Habitat fragmentation and declines in population sizes alter genetic diversity Loss or introduction of new functional groups such as nitrogen fixers or rodents onto islands can strongly alter ecosystem processes Changes in landscape diversity through habitat modification and fragmentation alter the nature of processes within and among vegetation patches Although both ecological changes altering the earth system and the loss of biotic diversity have been major sources of concern in recent years these concerns have been largely independent with little concern for the environmental causes the ecosystem consequences of changes in biodiversity These two processes are clearly interrelated Changes in ecological systems cause changes in diversity *Pattern and Process in Macroecology* Kevin Gaston,Tim Blackburn,2008-04-15 Issues of scale have become increasingly important to ecologists This book addresses the structure of regional large scale ecological assemblages or communities and the influence this has at a local small scale level This macroecological perspective is essential for the broader study of ecology because the structure and function of local communities cannot be properly understood without reference to the region in which they are situated The book reviews and synthesizes the issues of current importance in macroecology providing a balanced summary of the field that will be useful

for biologists at advanced undergraduate level and above These general issues are illustrated by frequent reference to specific well studied local and regional assemblages an approach that serves to relate the macroecological perspective which is perhaps often difficult to comprehend to the everyday experience of local sites Macroecology is an expanding and dynamic discipline The broad aim of the book is to promote an understanding of why it is such an important part of the wider program of research into ecology Summarises the current macroecological literature Provides numerous examples of key patterns Explicitly links local and regional scale processes Exploits detailed knowledge of one species assemblage to explore broad issues in the structuring of biodiversity
