

papers on the potential military and civilian applications of electrotextile technology along with many other papers on signal propagation in electrotextile circuits, color changing and touch sensing flexible textile circuits, manufacturing aspects, washing electrotextiles, mechanical testing, and electroluminescent textiles. Other papers, perhaps of more current interest to our readers, include silicon thin-film transistors on kapton fibers and a few papers on printing polymer circuits (basically screen printing semiconductive polymers on flexible substrates). Two other papers that may also be of interest are thin-film solid-state batteries for body-worn electronics and power generation from piezoelectric fiber composites.

Researchers who are working or want to work in this new and growing field of electrotextiles would find this volume to be very useful and interesting for quickly learning about the area up to 2003.

Even though this volume is dedicated to a single subject, nano and bionanomaterials, there are still many articles that may interest our readers who work in nanotechnology. While many of the articles are focused at biomedical applications, which is not the primary focus of our readers, some articles of more general interest to the materials researcher include quantum dot opto-electronic devices, synthesis of large volume nanoparticles, physics of self-assembled quantum dots, properties of carbon nanotubes, and unconventional nanofabrication. The first of these articles reviews the growth and electronic properties of InGaAs quantum dots with applications for lasers and detectors.

The article on making large volume nanoparticles covers methods for synthesizing for a number of materials including metals, semiconductors, oxides, and inorganics. The article on the device physics of quantum dots shows some of the more important recent advances in ensembles and single quantum dots. The article on the properties of carbon nanotubes (CNT's) covers atomic structure, electronic structure, vibrational, optical, mechanical, and thermal properties of various CNT's. Also covered are nanotube junctions, nanotube filling, and double-wall nanotubes. The last article mentioned dis-

cusses unconventional methods for nanofabrication. Methods discussed are soft lithography, scanning probe lithography, and edge lithography. The advantages, limitations, and applications for each method are also discussed. At the end of each article, there is an extensive listing of up-to-date references.
