Animal Vision:

Polarized Light in Animal Vision Gábor Horváth, Dezső Varju, 2013-06-29 The subject of this volume is two fold First it gathers typical polarization patterns occurring in nature Second it surveys the polarization sensitive animals the physiological mechanisms and biological functions of polarization sensitivity as well as the polarization guided behaviour in animals The monograph is prepared for biologists physicists and meteorologists especially for experts of atmospheric optics and animal vision who wish to understand and reveal the message hidden in polarization patterns of the optical environment not directly accessible to the human visual system but measurable by polarimetry and perceived by many animals Our volume is an attempt to build a bridge between these two physical and biological fields In Part I we introduce the reader to the elements of imaging polarimetry This technique can be efficiently used e g in atmospheric optics remote sensing and biology In Part II we deal with typical polarization patterns of the natural optical environment Sunrise sunset clear skies cloudy skies moonshine and total solar eclipses all mean quite different illumination conditions which also affect the spatial distribution and strength of celestial polarization We present the polarization patterns of the sky and its unpolarized neutral points under sunlit moonlit clear cloudy and eclipsed conditions as a function of solar elevation The polarization pattern of a rainbow is also shown That part of the spectrum is derived in which perception of skylight polarization is optimal under partly cloudy skies

The Vision

Revolution Mark Changizi, 2010-06-08 In The Vision Revolution How the Latest Research Overturns Everything We Thought We Knew About Human Vision Mark Changizi prominent neuroscientist and vision expert addresses four areas of human vision and provides explanations for why we have those particular abilities complete with a number of full color illustrations to demonstrate his conclusions and to engage the reader Written for both the casual reader and the science buff hungry for new information The Vision Revolution is a resource that dispels commonly believed perceptions about sight and offers answers drawn from the field s most recent research Changizi focuses on four why questions 1 Why do we see in color 2 Why do our eyes face forward 3 Why do we see illusions 4 Why does reading come so naturally to us Why Do We See in Color It was commonly believed that color vision evolved to help our primitive ancestors identify ripe fruit Changizi says we should look closer to home ourselves Human color vision evolved to give us greater insights into the mental states and health of other people People who can see color changes in skin have an advantage over their color blind counterparts they can see when people are blushing with embarrassment purple faced with exertion or the reddening of rashes Changizi s research reveals that the cones in our eyes that allow us to see color are exquisitely designed exactly for seeing color changes in the skin And it s no coincidence that the primates with color vision are the ones with bare spots on their faces and other body parts Changizi shows that the development of color vision in higher primates closely parallels the loss of facial hair culminating in the near hairlessness and highly developed color vision of humans Why Do Our Eyes Face Forward Forward facing eyes set us apart from most mammals and there is much dispute as to why we have them While some speculate that we evolved this feature to give us depth perception available through stereo vision this type of vision only allows us to see short distances and we already have other mechanisms that help us to estimate distance Changizi s research shows that with two forward facing eyes primates and humans have an x ray ability Specifically we re able to see through the cluttered leaves of the forest environment in which we evolved This feature helps primates see their targets in a crowded encroached environment To see how this works hold a finger in front of your eyes You ll find that you re able to look through it at what is beyond your finger One of the most amazing feats of two forward facing eyes Our views aren t blocked by our noses beaks etc Why Do We See Illusions We evolved to see moving objects not where they are but where they are going to be Without this ability we couldn t catch a ball because the brain s ability to process visual information isn t fast enough to allow us to put our hands in the right place to intersect for a rapidly approaching baseball If our brains simply created a perception of the way the world was at the time light hit the eye then by the time that perception was elicited which takes about a tenth of a second for the brain to do time would have marched on and the perception would be of the recent past Changizi explains Simply put illusions occur when our brain is tricked into thinking that a stationary two dimensional picture has an element

that is moving Our brains project the moving element into the future and as a result we don't see what's on the page but what our brain thinks will be the case a fraction of a second into the future Why Does Reading Come So Naturally to Us We can read faster than we can hear which is odd considering that reading is relatively recent
