Productivity Analysis Ali Dogramaci, 2012-12-06

There is a wide variety of perspectives for productivity analysis. The backgrounds of different researchers and practitioners who work on this topic include such fields as economics, business administration and industrial engineering among others. Within each such field there are different schools of thought on the theory and application of productivity analysis. Often it is not difficult to observe a lack of communication among the advocates of these separate schools. The purpose of this book is to present in a single volume samples of alternative approaches to productivity analysis. This may be considered as a first step toward a better communication among practitioners and researchers in the fields of management, industrial engineering and economics. The focus of the book is on the United States where the productivity growth problem has been acute for some time. The book begins with a brief overview chapter that covers some of the issues involved in productivity analysis and a sample of methodological approaches presently in use. After this introduction we move to Chapter 2 where Solomon Fabricant presents the issues related to measurement and analysis at the macroeconomic level. In Chapter 3 C. Lowell Harriss discusses concepts that he considers essential for productivity growth: capital formation, technological progress and freedom. **The**

Economics of Production and Innovation Gerhard Rosegger, 1986. The role of technology and innovation in increasing the competitiveness of firms and industries in domestic and international markets is of major concern to economists, industrial managers and public officials. The author provides an introduction into the economic analysis of production and technological change, exploring innovation in the broadest sense as an economic activity. Operations Management Ray Wild, 1980

Management Control Samuel Eilon, 1979. Identifies the control function as a central theme in the management process. The essential ingredients of control include the specification of a goal or goals, a measurement task, feedback information on performance and the decision to take corrective action. The absence of any of these ingredients can only result in the action being ineffective. The absence of any of these ingredients can only result in the management activity becoming ineffectual or even meaningless. A manager may therefore be identified as a controller of a system and the book proceeds to explore first the relationships between a controller and his system and secondly the interactions between several controllers operating within the same system. The nature of the decision making process is then analysed and various types of decisions are identified followed by a discussion of problems associated with organizational design. **Subject Catalog** Library of Congress, 1977 *The*
