(Hemiptera - Heteroptera, Gerromorpha & Nepomorpha)** Nils Møller Andersen,Tom A. Weir,2021-10-25 Water bugs are familiar insects in aquatic habitats throughout the World They belong to the order Hemiptera the largest insect order with incomplete metamorphosis There are basically

two kinds 1 the semiaquatic bugs Gerromorpha which live upon the water surface and 2 the true water bugs Nepomorpha which live beneath the water surface Water bugs are found in a wide variety of natural habitats from small temporary pools to larger ponds and lakes from small streams to rivers and from inland freshwater bodies to coastal mangroves tidal pools of coral reefs and the surface of the ocean Water bugs are chiefly predators or scavengers feeding on any prey they can master from tiny crustaceans and insects to tadpoles and small fish They play a major role in aquatic ecosystems and may serve as indicators of the biological quality of aquatic habitats They are chiefly beneficial to man since many species prey on mosquitoes and are themselves preyed upon by fish Because of their diverse lifestyles and because they are easily observed in their natural habitats water bugs are excellent model organisms in evolutionary biology ecology and conservation biology This handbook is the first comprehensive guide facilitating the identification of Australian water bugs It provides an overview on all 15 families 17 subfamilies and 55 genera known to occur on mainland Australia Tasmania and nearby islands Illustrated keys featuring a minimum of technical language are offered to assist with the identification of adult water bugs For each genus the handbook includes a description of the characters used to identify the genus and to separate the genus from similar genera an illustration to show overall appearance habitus of a representative species an illustrated key to species recorded from Australia overview of the biology of the genus and a map showing the locations where the genus has been found in Australia

Insect Biodiversity Robert G. Foottit, Peter H. Adler, 2009-03-03 Insect Biodiversity Science and Society brings together leading scientific experts to assess the impact insects have on humankind and the earth's fragile ecosystems It examines why insect biodiversity matters and how the rapid evolution of insect species is affecting us all Insects and related arthropods make up more than 50 percent of the known animal diversity globally yet a lack of knowledge about insects is hindering the advance of science and society This book explores the wide variety in type and number of insect species and their evolutionary relationships Case studies offer assessments on how insect biodiversity can help meet the needs of a rapidly expanding human population and also examine the consequences that an increased loss of insect species will have on the world The book concludes that a better understanding of the biology and ecology of insects is the only way to sustainably manage ecosystems in an ever changing global environment
