Computation and Information** F. de Martini,C. Monroe,2003-02-12 This Fermi Summer School of Physics on Experimental
Quantum Information and Computing represents a primer on one of the most intriguing and rapidly expanding new areas of
physics In this part the interest in quantum information QI science is due to the discovery that a computer operating on
quantum mechanical principles can solve certain important computational problems exponentially faster than any
conceivable classical computer But this interest is also due to the interdisciplinary nature of the field the rapid growth is
attributable in part to the stimulating confluence of researchers and ideas from physics chemistry mathematics information
theory and computer science Physics plays a paramount role in QI science as we realize that computing is itself a physical
process subject to physical laws The incredible growth of classical computers and information processors in the 20th century
stems from Turing s notion that a computer is independent of the physical device actually being used be they relays vacuum
tubes or semiconductor transistors As we strive to build useful quantum information processors into the 21st century we thus
look for any physical system that obeys the laws of quantum mechanics from single photons and atoms to quantum
superconducting devices These Fermi lectures take us on a journey through these and other promising current experimental
candidates for QI processing spanning quantum optics and laser physics atomic and molecular physics physical chemistry
and condensed matter physics While this broad coverage of experimental physics represents a challenge to the student such
an appreciation of these fields will be critical in the future success of quantum technology Indeed the most exciting feature of
QI science is that the technology ultimately leading to a quantum processor is likely presently unknown *International*

Congress Calendar, 1996 **A New Generation of High-Power, Waveform Controlled, Few-Cycle Light Sources**

Marcus Seidel, 2019-02-01 This thesis presents first successful experiments to carrier envelope phase stabilize a high power mode locked thin disk oscillator and to compress the pulses emitted from this laser to durations of only a few optical cycles Moreover the monograph introduces several methods to achieve power scalability of compression and stabilization techniques All experimental approaches are compared in detail and may serve as a guideline for developing high power waveform controlled few cycle light sources which offer tremendous potential to exploit extreme nonlinear optical effects at unprecedentedly high repetition rates and to establish table top infrared light sources with a unique combination of brilliance and bandwidth As an example the realization of a multi Watt multi octave spanning mid infrared femtosecond source is described The thesis starts with a basic introduction to the field of ultrafast laser oscillators It subsequently presents additional details of previously published research results and establishes a connection between them It therefore addresses both newcomers to and experts in the field of high power ultrafast laser development

Advances in Optical Amplifiers

Paul Urquhart, 2011-02-14 Optical amplifiers play a central role in all categories of fibre communications systems and networks By compensating for the losses exerted by the transmission medium and the components through which the signals pass they reduce the need for expensive and slow optical electrical optical conversion The photonic gain media which are normally based on glass or semiconductor based waveguides can amplify many high speed wavelength division multiplexed channels simultaneously Recent research has also concentrated on wavelength conversion switching demultiplexing in the time domain and other enhanced functions Advances in Optical Amplifiers presents up to date results on amplifier performance along with explanations of their relevance from leading researchers in the field Its chapters cover amplifiers based on rare earth doped fibres and waveguides stimulated Raman scattering nonlinear parametric processes and semiconductor media Wavelength conversion and other enhanced signal processing functions are also considered in depth This book is targeted at research development and design engineers from teams in manufacturing industry academia and telecommunications service operators
