Approaching Human

Performance Markus Grebenstein, 2014-01-24 Humanoid robotics have made remarkable progress since the dawn of robotics. So why don't we have humanoid robot assistants in day-to-day life yet? This book analyzes the keys to building a successful humanoid robot for field robotics where collisions become an unavoidable part of the game. The author argues that the design goal should be real anthropomorphism as opposed to mere human-like appearance. He deduces three major characteristics to aim for when designing a humanoid robot, particularly robot hands: Robustness against impacts, Fast dynamics, and Human-like grasping and manipulation performance. Instead of blindly copying human anatomy, this book opts for a holistic design methodology. It analyzes human hands and existing robot hands to elucidate the important functionalities that are the building blocks toward these necessary characteristics. They are the keys to designing an anthropomorphic robot hand as illustrated in the high-performance anthropomorphic Awiwi Hand presented in this book. This is not only a handbook for robot hand designers; it gives a comprehensive survey and analysis of the state of the art in robot hands as well as the human anatomy. It is also aimed at researchers and roboticists interested in the underlying functionalities of hands grasping and manipulation. The methodology of functional abstraction is not limited to robot hands; it can also help realize a new generation of humanoid robots to accommodate a broader spectrum of the needs of human society.

Recent Advances in

Mobile Robotics Andon Topalov, 2011-12-14 Mobile robots are the focus of a great deal of current research in robotics. Mobile robotics is a young multidisciplinary field involving knowledge from many areas including electrical, electronic, and mechanical engineering, computer, cognitive, and social sciences. Being engaged in the design of automated systems, it lies at the intersection of artificial intelligence, computational vision, and robotics. Thanks to the numerous researchers sharing their goals, visions, and results within the community, mobile robotics is becoming a very rich and stimulating area. The book *Recent Advances in Mobile Robotics* addresses the topic by integrating contributions from many researchers around the globe. It emphasizes the computational methods of programming mobile robots rather than the methods of constructing the hardware. Its content reflects different complementary aspects of theory and practice which have recently taken place. We believe that it will serve as a valuable handbook to those who work in research and development of mobile robots.

Creating Brain-Like Intelligence Bernhard Sendhoff, Edgar Körner, Olaf Sporns, Helge Ritter, Kenji Doya, 2009-03-13

The International Symposium Creating Brain Like Intelligence was held in February 2007 in Germany. The symposium brought together notable scientists from different backgrounds and with different expertise related to the emerging field of brain like intelligence. Our understanding of the principles behind brain like intelligence is still limited. After all we have had to acknowledge that after tremendous advances in areas like neural networks, computational and artificial intelligence, a field that had just celebrated its 50 year anniversary and fuzzy systems, we are still not able to mimic even the lower level sensory capabilities of humans or animals. We asked what the biggest obstacles are and how we could gain ground toward a scientific understanding of the autonomy, flexibility and robustness of intelligent biological systems as they strive to survive. New principles are usually found at the interfaces between existing disciplines and traditional boundaries between disciplines have to be broken down to see how complex systems become simple and how the puzzle can be assembled. During the symposium we could identify some recurring themes that pervaded many of the talks and discussions: The triad of structure, dynamics and environment; the role of the environment as an active partner in shaping systems; adaptivity on all scales; learning, development, evolution and the amalgamation of an internal and external world in brain like intelligence; rate high among them. Each of us is rooted in a certain community which we have to serve with the results of our research. Looking beyond our fields and working at the interfaces between established areas of research requires effort and an active process.

Mobile Robots
John X. Liu, 2005. Cybersecurity refers to three things: measures to protect information technology, the information it contains, processes and transmits, and associated physical and virtual elements which together comprise cyberspace; the degree of protection resulting from application of those measures; and the associated field of professional endeavor. Virtually any element of cyberspace can be at risk and the degree of interconnection of those elements can make it difficult to determine the extent of the cybersecurity framework that is needed. Identifying the major weaknesses in U.S. cybersecurity is an area of some controversy; the defense against attacks on computer systems and associated infrastructure has appeared to be generally fragmented and varying widely in effectiveness.

Feedback Control of Dynamic Bipedal Robot Locomotion

Eric R. Westervelt, Jessy W. Grizzle, Christine Chevallereau, Jun Ho Choi, Benjamin Morris, 2018-10-03. Bipedal locomotion is among the most difficult challenges in control engineering. Most books treat the subject from a quasi-static perspective overlooking the hybrid nature of bipedal mechanics. Feedback Control of Dynamic Bipedal Robot Locomotion is the first book to present a comprehensive and mathematically sound treatment of feedback design for achieving stable, agile and efficient locomotion in bipedal robots. In this unique and groundbreaking treatise, expert authors lead you systematically through every step of the process, including: Mathematical modeling of walking and running gaits in planar robots; Analysis of periodic orbits in hybrid systems; Design and analysis of feedback systems for achieving stable periodic motions; Algorithms for synthesizing feedback controllers; Detailed simulation examples; Experimental implementations on two bipedal test beds. The elegance of

the authors approach is evident in the marriage of control theory and mechanics uniting control based presentation and mathematical custom with a mechanics based approach to the problem and computational rendering Concrete examples and numerous illustrations complement and clarify the mathematical discussion A supporting Web site offers links to videos of several experiments along with MATLAB code for several of the models This one of a kind book builds a solid understanding of the theoretical and practical aspects of truly dynamic locomotion in planar bipedal robots
