Neurosurgery of Arteriovenous Malformations and Fistulas Robert Schmid-Elsaesser, Alexander Muacevic, Hartmut Brückmann, Berndt Wowra, 2012-12-06 Arteriovenous malformations (AVM) and fistulas (AVF) differ from all other pathology affecting the central nervous system by their high flow arteriovenous shunts. Permanent occlusion of these shunts is the essence and the challenge of therapy. Much progress has been made since the first neurosurgical efforts to deal with these problems. Endovascular therapy and radiosurgery became accepted alternatives or adjuncts to surgery. In many instances, the choice of the primary therapeutic modality is not clear, and arguments can be found for several options. However, microsurgery, endovascular therapy, and radiosurgery differ very much with regard to invasiveness, length of stay at the hospital, but also residual risk after therapy. These secondary factors are often decisive for the choice of treatment modality. The book presents in a clearly structured way the modern treatment concepts. It has been written for all colleagues involved in surgery, radiosurgery, and endovascular therapy of neurovascular malformations.

Christine K. Cassel, Rosanne Leipzig, Harvey Jay Cohen, Eric B. Larson, Diane E. Meier, 2006-05-29 Since the publication of the third edition of Geriatric Medicine extraordinary advances have occurred in the science of aging and the potential for biomedical research to give us answers to many if not most of the age related disorders that threaten the quality of life in older years At the most basic level the successful mapping of the human genome was declared complete in the fall of 2000 Understanding the map of the human genome is as important as understanding the map of genomes of important laboratory species ranging from the microscopic worms and fruit flies used in most classic genetic studies to rodents such as laboratory mice and eventually to primates on which much of the research on the aging human brain is done The genetic maps of all of these species including our own does not answer clinical questions but it does open the door to dramatic rapid and efficient answers to questions about the genetic polymorphisms related to diseases in humans The telomerase story also unfolded since the third edition Telomerase is an enzyme responsible for maintaining the telomeres the redundant DNA portions at the end of chromosomes whose shortening seems to be linked directly to cell senescence apoptosis and the control over cell death which at the level of the individual cell seems to be linked to the decline of organ function and eventually aging and death within the organism
