Cundall,2013-11-11 At the time that the editors conceived the idea of trying to organize the meeting on which the contents of this volume are based and which became in March 1980 a NATO Advanced Study Institute the techniques of time resolved fluorescence spectroscopy in both the nanosecond and sub nanosecond time domains might reasonably have been said to be coming of age both in their execution and in the analysis and interpretation of the results obtained These techniques then as now comprised mainly a number of pulse methods using laser flash lamp or most recently synchrotron radiation In addition significant developments in the more classical phase approach had also rendered that method popular utilizing either modulation of an otherwise continuous source or again recently the ultra rapid pulse rate attainable with a synchrotron source In general terms time resolved fluorescence studies are capable under appropriate conditions of supplying direct kinetic information on both photophysics and various aspects of molecular macromolecular and supramolecular structure and dynamics The nanosecond and sub nanosecond time scales directly probed render these techniques particularly appropriate
