Shingareva, Carlos Lizárraga-Celaya, 2010-04-29 In the history of mathematics there are many situations in which calculations were performed incorrectly for important practical applications Let us look at some examples the history of computing the number began in Egypt and Babylon about 2000 years BC since then many mathematicians have calculated e.g. Archimedes Ptolemy VI etc etc The first formula for computing decimal digits of π was discovered by J. Machin in 1706 who was the first to correctly compute 100 digits of π Then many people used his method e.g. W. Shanks calculated with 707 digits within 15 years although due to mistakes only the first 527 were correct For the next examples we can mention the history of computing the π constant that was first discovered by A. Sommerfeld and the mathematical tables exact calculations and formulas published in many mathematical textbooks were not verified rigorously 25 These errors could have a large effect on results obtained by engineers But sometimes the solution of such problems required such technology that was not available at that time In modern

mathematics there exist computers that can perform various mathematical operations for which humans are incapable. Therefore the computers can be used to verify the results obtained by humans to discover new results to prove the results that a human can obtain without any technology. With respect to our example of computing we can mention that recently in 2002 Y. Kanada, Y. Ushiro, H. Kuroda, and M. Michael J. Kahana, Anthony D. Louvier, 1966. **AlphaGo Simplified** Mark Liu, 2024-08-27. May 11, 1997 was a watershed moment in the history of artificial intelligence (AI): the IBM supercomputer chess engine Deep Blue beat the world Chess champion Garry Kasparov. It was the first time a machine had triumphed over a human player in a Chess tournament. Fast forward 19 years to May 9, 2016: DeepMind's AlphaGo beat the world Go champion Lee Sedol. AI again stole the spotlight and generated a media frenzy. This time a new type of AI algorithm, namely machine learning (ML), was the driving force behind the game strategies. What exactly is ML? How is it related to AI? Why is deep learning (DL) so popular these days? This book explains how traditional rule-based AI and ML work and how they can be implemented in everyday games such as Last Coin Standing, Tic Tac Toe, or Connect Four. Game rules in these three games are easy to implement. As a result, readers will learn rule-based AI, deep reinforcement learning, and more importantly, how to combine the two to create powerful game strategies. The whole

is indeed greater than the sum of its parts without getting bogged down in complicated game rules Implementing rule based AI and ML in these straightforward games is quick and not computationally intensive Consequently game strategies can be trained in mere minutes or hours without requiring GPU training or supercomputing facilities showcasing AI s ability to achieve superhuman performance in these games More importantly readers will gain a thorough understanding of the principles behind rule based AI such as the MiniMax algorithm alpha beta pruning and Monte Carlo Tree Search MCTS and how to integrate them with cutting edge ML techniques like convolutional neural networks and deep reinforcement learning to apply them in their own business fields and tackle real world challenges Written with clarity from the ground up this book appeals to both general readers and industry professionals who seek to learn about rule based AI and deep reinforcement learning as well as students and educators in computer science and programming courses
