Aromatase Inhibition And Breast Cancer:

Aromatase Inhibition and Breast Cancer William R. Miller, Richard Santen, 2000-09-29 Presents evidence that letrozole anastrozole and exemestane have proven efficacy as second line therapy and indicate increased antitumor effects and less toxicity than older aromatase inhibitors and progestins This reference provides a state of the art assessment of drugs that inhibit the synthesis of estrogens particularly agents used to treat breast cancer and demonstrates how the endocrinological effects of the new generation of inhibitors translate into clinical benefits Highlights recent key research aimed at developing novel reagents and technology to optimize drug therapies and expand their clinical applications With contributions from over 75 international experts Aromatase Inhibition and Breast Cancer reviews the preclinical development of aromatase inhibitors and their place in the current practice of breast cancer management considers aromatase inhibitors for early stages of breast cancer as an adjuvant to surgery explains how machine learning techniques accurately identify tumors likely to respond to treatment gives an immunohistological evaluation of aromatase protein and RT PCR measurements at the level of mRNA describes how model systems based on human material have optimized the use and demonstrated the potential of aromatase inhibitors presents the case for employing aromatase inhibitors to treat pubertal gynecomastia prostate cancer and benign and malignant endometrial conditions and more Given the remarkable endocrine effects and the clinical potential of the new generation of aromatase inhibitors Aromatase Inhibition and Breast Cancer is an essential reference for oncologists endocrinologists gynecologists obstetricians pharmacologists family physicians reproductive biologists and medical school students in these disciplines

Aromatase Inhibitors B.J.A. Furr, 2006-02-20 Many breast tumours are dependent upon oestrogen for their development and continued growth Over the last 25 years hormone therapy has progressed from the irreversible destruction of endocrine glands to the use of drugs that reversibly suppress oestrogen synthesis or action The inhibition of oestrogen synthesis is most readily achieved by inhibiting the final step in the pathway of oestrogen biosynthesis the reaction which transforms androgens into oestrogens by creating an aromatic ring in the steroid molecule hence the enzyme's trivial name aromatase Whereas the first aromatase inhibitors to be used therapeutically could be shown to produce drug induced inhibition of the enzyme and therapeutic benefits in patients with breast cancer they were not particularly potent and lacked specificity However second generation drugs were developed and most recently third generation inhibitors have evolved which possess remarkable specificity and potency Initial results from clinical trials suggest that these agents will become the cornerstones of future endocrine therapy

Resistance to Aromatase Inhibitors in Breast Cancer Alexey Larionov, 2015-04-25 Aromatase Inhibitors AIs treat postmenopausal estrogen receptor positive tumours which constitute the majority of breast cancer patients This comprehensive volume brings together the current knowledge from different relevant areas including molecular mechanisms and translational aspects of drug resistance in AIs Topics covered include research experimental and clinical data specifically focused on AI resistance in

breast cancer The volume will include three sections The first section covers general knowledge about aromatase inhibitors including regulation of aromatase genes and structure and function of aromatase protein The second section provides the detailed mechanisms of resistance to AIs while the third section explores prediction of resistance and potential strategies to overcome resistance Breast cancer is the most common female cancer and AIs significantly improve treatments outcomes compatibly to previously used endocrine treatments However 10 15% of post operative patients develop a relapse during adjuvant treatment with AIs about 25 50% of the patients do not respond to AIs in neo adjuvant or metastatic setting and the majority of metastatic patients who initially respond develop resistance within 3 years There is an important need to understand these mechanisms of resistance in order to develop methods of preventing or overcoming the resistance to AIs which will ensure a more successful outcome in treating breast cancer

Endocrine Therapy in Breast Cancer William R. Miller, James N. Ingle, 2002-03-08 This reference evaluates and describes the latest strategies for hormone suppression and blockade in the management of early and advanced stage breast cancer and explores the effects of tamoxifen selective estrogen receptor modulators SERMs aromatase inhibitors and their combination on both breast cancers and normal tissues

Endocrine T **Managing Breast Cancer Risk** Monica Morrow, Virgil Craig Jordan, 2003 Managing Breast Cancer Risk is a single source for information needed by primary care physicians nurses gynecologists as well as oncologic specialists who deal with women who are concerned about breast cancer Its purpose is to bring together a multidisciplinary group of experts to address breast cancer risk in a clinically meaningful way Chapters providing detailed information on individual risk factors are accompanied by a discussion of models which integrate multiple factors for a more complete assessment of risk Traditional strategies for risk management including surveillance and prophylactic surgery are reviewed and the data on newer techniques such as ductal lavage and screening with magnetic resonance is presented The rational for chemoprevention with selective estrogen receptor modulators SERMS is discussed and the evidence for tamoxifen as a chemopreventative is updated The potential for chemoprevention with newer SERMS and the aromatase inhibitors is reviewed Finally the critical and often ignored areas of quality of life and symptom management are addressed

Trends in Breast Cancer Research Andrew P. Yao, 2005 Breast cancer is a malignant tumour that has developed from cells of the breast A malignant tumour is a group of cancer cells that may invade surrounding tissues or spread metastasize to distant areas of the body The disease occurs almost entirely in women but men can get it as well The main types of breast cancer are ductal carcinoma in situ invasive ductal carcinoma lobular carcinoma in situ invasive lobular carcinoma medullary carcinoma and Paget s disease of the nipple About 1 of 8 women will get it in her lifetime This new book presents state of the art research in this fast moving field
