ethics economics and psychology The colloquium organizers strove to create an event that would provide attendees with a wide overview on the current state of the philosophy of biology with as many topics and views on these topics as possible Those presentations are gathered here in a volume that offers the reader a varied and thorough survey of the field

The Concept of Scientific Law in the Philosophy of Science and Epistemology Igor Hanzel, 2013-03-14 The author argues that a reconstruction of scientific laws should give an account of laws relating phenomena to underlying mechanisms generating them as well as of laws relating this mechanism to its inherent capacities While contemporary philosophy of science deals only with the former the author provides the concept for the reconstruction of scientific laws where the knowledge of the phenomena enables one to grasp the quantity of their cause He then provides the concepts for scientific laws dealing with the relation of the quantity and quality of the cause underlying phenomena to the quality and quantity of its capacities Finally he provides concepts for scientific laws expressing how a certain cause due to the quantity and quality of its capacities generates the quantitative and qualitative determinations of its manifestations The book is intended for philosophers of science and philosophers of social science as well as for natural and social scientists

Interdisciplinary Foundations for the Science of Emotion Cecilea Mun, 2021-06-22 In this book Cecilea Mun introduces an innovative meta framework for conducting interdisciplinary research in the science of emotion broadly construed as well as a framework for a particular kind of theory of emotion She provides new solutions and arguments in support of an embodied cognitive approach to resolving a wide range of problems including those concerning skepticism the place of ordinary intuitions for the science of emotion intentionality the rationality of emotions naturalizing knowledge and the debate between philosophical cognitive and noncognitive theories of emotion Her solutions include a revolutionary unifying interdisciplinary taxonomy of theories of emotion which allows one to understand the discourse in the science of emotion as a debate between four fundamental types of theories realism instrumentalism eliminativism and eliminative realism Her original proposal for a conception of intentionality that makes sense of our ordinary intuitions is also combined with her comprehensive account of rationality to articulate a groundbreaking understanding of the structure of human rationality All of the contributions made herein together provide the foundations for a profound understanding of emotions including as a kind of embodied language

Wayne A. Davis,2002-11-11 This philosophical treatise on the foundations of semantics is a systematic effort to clarify deepen and defend the classical doctrine that words are conventional signs of mental states principally thoughts and ideas and that meaning consists in their expression This expression theory of meaning is developed by carrying out the Gricean programme explaining what it is for words to have meaning in terms of speaker meaning and what it is for a speaker to mean something in terms of intention But Grice s own formulations are rejected and alternatives developed The foundations of the expression theory are explored at length and the author develops the theory of thought as a fundamental cognitive phenomenon distinct from belief and desire argues for the thesis that thoughts have parts and identifies ideas or concepts with parts of thoughts This book will appeal to students and professionals interested in the philosophy of language **The challenges of**

consciousness research in light of the variations of conscious experience Christopher Gutland,Kelin Li,Marcela Venebra,Sucharit Katyal,Alexander Nicolai Wendt,2024-02-29 **Applying Cognitive Science to Education**

Frederick Reif,2008 An accessible introduction to some of the cognitive issues important for thinking and learning in scientific or other complex domains such as mathematics physics chemistry engineering or expository writing with practical educational applications and implementation methods Many students find it difficult to learn the kind of knowledge and thinking required by college or high school courses in mathematics science or other complex domains Thus they often emerge with significant misconceptions fragmented knowledge and inadequate problem solving skills Most instructors or textbook authors approach their teaching efforts with a good knowledge of their field of expertise but little awareness of the underlying thought processes and kinds of knowledge required for learning in scientific domains In this book Frederick Reif presents an accessible coherent introduction to some of the cognitive issues important for thinking and learning in scientific or other complex domains such as mathematics science physics chemistry biology engineering or expository writing Reif whose experience teaching physics at the University of California led him to explore the relevance of cognitive science to education examines with some care the kinds of knowledge and thought processes needed for good performance discusses the difficulties faced by students trying to deal with unfamiliar scientific domains describes some explicit teaching methods that can help students learn the requisite knowledge and thinking skills and indicates how such methods can be implemented by instructors or textbook authors Writing from a practically applied rather than predominantly theoretical perspective Reif shows how findings from recent research in cognitive science can be applied to education He discusses cognitive issues related to the kind of knowledge and thinking skills that are needed for science or mathematics courses in high school or colleges and that are essential prerequisites for more advanced intellectual performance In particular he argues that a better understanding of the underlying cognitive mechanisms should help to achieve a more scientific approach to science education *Scientific Objectivity and Its Contexts* Evandro Agazzi,2014-03-11 The first part of this book is of an

epistemological nature and develops an original theory of scientific objectivity understood in a weak sense as intersubjective agreement among the specialists and a strong sense as having precise concrete referents In both cases it relies upon the adoption of operational criteria designed within the particular perspective under which any single science considers reality The object so attained has a proper ontological status dependent on the specific character of the criteria of reference regional ontologies This justifies a form of scientific realism Such perspectives are also the result of a complex cultural historical situation The awareness of such a historical determinacy of science justifies including in the philosophy of science the problems of ethics of science relations of science with metaphysics and social dimensions of science that overstep the traditional restriction of the philosophy of science to an epistemology of science It is to this context that the second part of the book is devoted

Terms of Inquiry James W. Davis, 2005-06-07 James W Davis critically examines central claims and assumptions made by proponents of the scientific method in general as well as the specific problems confronting the social sciences in particular developing a middle ground between the uncritical application of the scientific method in pursuit of empirical truths and the postmodernist assertion that there is no foundation upon which to build an edifice of social science

Scientific Progress Craig Dilworth, 2013-03-09 For the philosopher interested in the idea of objective knowledge of the real world the nature of science is of special importance for science and more particularly physics is today considered to be paradigmatic in its affording of such knowledge And no understanding of science is complete until it includes an appreciation of the nature of the relation between successive scientific theories that is until it includes a conception of scientific progress Now it might be suggested by some that there are a variety of ways in which science progresses or that there are a number of different notions of scientific progress not all of which concern the relation between successive scientific theories For example it may be thought that science progresses through the application of scientific method to areas where it has not previously been applied or through the development of individual theories However it is here suggested that the application of the methods of science to new areas does not concern forward progress so much as lateral expansion and that the provision of a conception of how individual theories develop would lack the generality expected of an account concerning the progress of science itself
