Concepts in Bioenergetics Leonardo Peusner, 1974 *Concepts in Bioenergetics* Leonardo Peusner, 1974 *Principles of Metabolic Control in Mammalian Systems* Herman, 2013-11-11 In this work we present the basic principles of metabolic control which we hope will serve as a foundation for the vast array of factual matter which the biochemist and the physician engaged in metabolic research must accumulate Accordingly we attempt to set forth these principles along with sufficient explanation so that the reader may apply them to the ever expanding literature of biochemistry If we are successful this will provide a theoretical approach which can be applied to any given set of metabolic reactions It is impossible to enumerate each and every biochemical reaction and pathway since such a work would be too unwieldy for efficient use Rather we hope our presentation of the principles of metabolic control will be sufficiently basic to be of lasting usefulness no matter how detailed biochemistry may become We would like to be able to condense biochemistry into a theoretical biology that will not only allow for the general treatment of any given reaction but will enable predictions to be made as to the existence of necessary pathways and the consequences of altered control Such is not possible today but this may be accomplished in the future We believe it is now possible to institute the beginnings of such a theoretical biology Current Catalog National Library of Medicine (U.S.), 1993 First multi year cumulation covers six years 1965-70 Books in Series, 1985 Vols for 1980 issued in three parts Series Authors and Titles *Catalog of Copyright Entries. Bowker LLC, 1979-05 Library of Congress Catalog Library of Congress, 1974-04 A cumulative list of works represented by Library of Congress printed cards **Nonlinear Electrodynamics in Biological Systems** W. Adey, 2012-12-06 The past half century has seen an extraordinary growth in the fields of cellular and molecular biology From simple morphological concepts of cells as the essential units of living matter

there has been an ever sharper focus on functional organization of living systems with emphasis on molecular dynamics. Thus life forms have come to be defined increasingly in terms of metabolism, growth, reproduction, and responses to environmental perturbations. Since these properties occur in varying degrees in systems below the level of cellular organization, there has been a blurring of older models that restricted the concepts of life to cellular systems. At the same time, a search has begun for elementary aspects of molecular and atomic behavior that might better define properties common to all life forms. This search has led to an examination of nonlinear behavior in biological macromolecules, whether in response to electrical or chemical stimulation, for example, or as a means of signaling along a molecular chain or as a means of energy transfer. Experimental knowledge in this area has grown rapidly in the past decade and in some respects has outstripped theoretical models adequate to explain these new observations. Nevertheless, it can be claimed that there is now an impressive body of experiments implicating non-linear nonequilibrium processes as fundamental steps in sequential operations of biological systems.

The Publishers' Trade List Annual, 1981 Bowker's Medical Books in Print, 1975 The Cambridge History of Science: Volume 6, The Modern Biological and Earth Sciences David C. Lindberg, Peter J. Bowler, Ronald L. Numbers, Roy Porter, 2003. This book in the highly respected Cambridge History of Science series is devoted to the history of the life and earth sciences since 1800. It provides comprehensive and authoritative surveys of historical thinking on major developments in these areas of science on the social and cultural milieus in which the knowledge was generated and on the wider impact of the major theoretical and practical innovations. The articles are written by acknowledged experts who provide concise accounts of the latest historical thinking coupled with guides to the most important recent literature. In addition to histories of traditional sciences, the book covers the emergence of newer disciplines such as genetics, biochemistry, and geophysics. The interaction of scientific techniques with their practical applications in areas such as medicine is a major focus of the book, as is its coverage of controversial areas such as science and religion and environmentalism.
