The administration of chemotherapeutic agents by continuous infusion with concomitant radiation therapy heralds a new approach in the treatment of cancer. This comprehensive book on the subject includes besides a discussion of its scientific basis the most promising clinical data on the use of continuous infusion chemotherapy and radiation. Thus it is an important update for clinical investigators involved in frontline research as well as for practicing physicians participating in the direct care of cancer patients. The contributions include the latest results of this new approach in a number of tumor sites. There is a detailed description of the principles of radiosensitization for malignant tumors and radioprotection for normal tissues; these are the principles which have led to concrete clinical applications. There is also a presentation of the most recent data on the beneficial effects resulting from the administration of commonly used drugs such as 5-fluorouracil, cisplatin, and adriamycin with concomitant radiation therapy. Much of the data has never before been published. The wealth of information in this volume makes it a valuable reference; at the same time it gives practicing physicians a detailed presentation of various therapeutic regimens which they could administer in their daily clinical practice. In the future, this innovative cancer treatment may lead to the decreased need for radical surgery and the increased ability to preserve organ function.

Handbook on Hyperbaric Medicine Daniel Mathieu, 2006-08-18. It is now ten years since the first Handbook on Hyperbaric Medicine was published. During this time there have been many major advances: our understanding of the actions of hyperbaric oxygenation has been elucidated by several studies; clinical practice is becoming more scientific; various consensus-derived organisational and operational recommendations and guidelines are now widely accepted. As for Europe, these positive developments are largely due to the continuous action of the European Committee for Hyperbaric Medicine (ECHM). One of the most successful initiatives was the start of a specific European research action sponsored by the EU Cooperation in Science and Technology (COST) programme. The specific COST Action for hyperbaric medicine (COST B14) has been completed and has provided the impetus for the publication of this new Handbook. This book is a reference document for researchers and clinicians and is also of excellent use for both teachers and students. Atlas of Endoanal and

Principles of Cancer Biotherapy R.K. Oldham, 2012-12-06. At the time of the first edition of Principles of Cancer Biotherapy, this book represented the first comprehensive textbook on biological therapy. Whereas in 1991, when the second edition was published, there was still some doubt on the part of many oncologists and cancer researchers as to the therapeutic value of these new approaches, it is now generally agreed that biopharmaceuticals are producing major opportunities for new cancer therapies. Cancer biotherapy has truly matured into the fourth modality of cancer treatment. The third edition is now needed as a result of the tremendous progress that has been made in recent years using biologicals in

cancer treatment The book summarizes an evolving science and a rapidly changing medical practice As we near the millennium it now becomes possible to envision a much more diversified system of cancer research and treatment that will afford greater opportunities for patients Some forms of cancer biotherapy use the strategy of tumour stabilization and control through continued biological therapy akin to the use of insulin in the treatment of diabetes This textbook illustrates new methods of thinking and new strategies for control of cancer It is always difficult to move from past dogma to future opportunity but this third edition of Principles of Cancer Biotherapy illustrates why it is so important to the patients for researchers and clinicians to explore and apply these new opportunities in cancer biotherapy

Cancer Chemotherapy by Infusion J.J. Lokich, 2012-12-06 Chemotherapy for cancer is in a state of evolution Because some cancers can now be cured with chemotherapy as a singular modality this therapy can no longer be viewed as simply a palliative contribution Chemotherapy has assumed an important role as an adjuvant to other modalities including both surgery and radiation therapy For some tumors the primary application of chemotherapy in a combined modality approach to curative therapy has resulted in the application of less radical surgery while achieving substantial of relatively rare tumors such as cure rates Nonetheless with the exception childhood tumors hematologic malignancies and testicular cancer the effectiveness of chemotherapy in most tumors is severely limited At the cellular level greater understanding of the specific mechanism of tumor cell killing and of the phenomenon of drug resistance are elusive critical ingredients in the improvement of effectiveness in cancer chemotherapy Prolonging the exposure time of the tumor cell to drugs is a concept that was addressed in the early phases of the development of chemotherapy However technological limitations inhibited the broader application of chemotherapy by infusion until recent years Also the convenience of intermittent therapy on an outpatient basis with the predominant theory of drug effect based on a dose response as well as the proven effectiveness of this schedule in some tumors has slowed the process of subjecting infusion chemotherapy to the rigors of clinical trials

biology The editors are grateful to the authors whose scholarship defines the quality of the book Educational lectures The pathogenesis of human cancer metastasis I Fidler Cancer is a collection of malignancies with each cancer of each organ consisting of numerous subsets This biologic and clinical heterogeneity is probably due to the different etiologies origins and selection pressures Despite this heterogeneity all malignant neoplasms have a uniform characteristic the ability to invade host tissues and produce metastases Clinical observations of cancer patients and studies with experimental rodent tumors have revealed that certain tumors produce metastasis to specific organs independent of vascular anatomy rate of blood flow and number of tumor cells delivered to each organ The distribution and fate of hematogeneously disseminated radiolabelled tumor cells in experimental rodent systems amply demonstrate that tumor cells reach the microvasculature of many organs

Clinical Applications of Continuous Infusion Chemotherapy and Concomitant Radiation Therapy C. Julian Rosenthal, Marvin Rotman, 2012-12-06 The first conference on concomitant infusion chemotherapy and radiation therapy was organized with the intention of bringing together some of the investigators who have tested during the last few years the hypothesis that continuous infusion chemotherapy could modulate the cytotoxic effect of radiation therapy to the point of having a strongly additive if not synergistic activity on certain malignant tumors This volume represents the detailed proceedings of this conference presented in a way that offers the reader a review of the ongoing research in the field We have stressed a number of subjects from basic biologic research and influence of cell kinetics to the practical methods of drug delivery systems and early clinical experiences The rationale for this new type of combined modality therapy has been presented by some of its pioneers Early clinical investigations as well as the preliminary data of many that have not yet completely matured have also been included The reader should look at these data with some reservations Ultimately these results must be confirmed by larger prospective randomized studies with proper controls before becoming accepted as the treatment of choice in locally advanced tumors Journal of the National Cancer Institute, 2001 Chemoradiation Madhu J.
