Textbook provides the basics of material and structural behaviour and the fundamental knowledge needed for the design assessment or retrofitting of concrete structures. It will be essential reading material for graduate students in the field of structural concrete and also assist designers and consultants in understanding the background to the rules they apply in their practice. Furthermore, it should prove particularly valuable to users of the new editions of Eurocode 2 for concrete buildings, bridges and container structures which are based only partly on MC90 and partly on more recent knowledge which was not included in the 1999 edition of the Textbook.

Structural Engineering, Mechanics and Computation A. Zingoni, 2001-03-16. Following on from the International Conference on Structural Engineering, Mechanics and Computation held in Cape Town in April 2001, this book contains the Proceedings in two volumes. There are over 170 papers written by authors from around 40 countries worldwide. The contributions include 6 Keynote Papers and 12 Special Invited Papers. In line with the aims of the SEMC 2001 International Conference and as may be seen from the List of Contents, the papers cover a wide range of topics under a variety of themes. There is a healthy balance between papers of a theoretical nature concerned with various aspects of structural mechanics.

and computational issues and those of a more practical nature addressing issues of design safety and construction. As the contributions in these Proceedings show, new and more efficient methods of structural analysis and numerical computation are being explored all the time, while exciting structural materials such as glass have recently come onto the scene. Research interest in the repair and rehabilitation of existing infrastructure continues to grow, particularly in Europe and North America, while the challenges to protect human life and property against the effects of fire, earthquakes and other hazards are being addressed through the development of more appropriate design methods for buildings, bridges and other engineering structures.

Structural Concrete Textbook - Vol 3, first edition fib Fédération internationale du béton, 1999. The development of reinforced and prestressed concrete during the last 50 years was highly promoted by the Comité Euro international du Béton CEB and the Fédération Internationale de la Précontrainte FIP. In 1998, these two associations merged, forming the Fédération Internationale du Béton fib. The results of CEB and FIP had been distributed in different ways, such as CEB Bulletins d'Information, FIP Reports, FIP Notes and CEB News. These Bulletins or reports comprised various kinds of information, such as State of the Art Reports, Research Reports, Application Manuals, Guides to Good Practice and the CEB/FIP Model Codes 1978 and 1990. These Model Codes provided design principles and application rules to the structural engineering profession and have been predominantly used for code drafting by many national and international standardizing bodies. The Textbook on Structural Concrete is now intended to provide background information and justification, especially for the CEB/FIP Model Code 90 and in some fields of recently extended knowledge. It is addressed to advanced students; this means that basic information on structural analysis and behaviour of structural concrete is a required prerequisite. Practising structural engineers may utilize it for gaining background information on the CEB/FIP Model Code 90 and national or regional codes, as for example EUROCODE 2 based on MC 90. The Textbook is also conceived to assist teachers at technical universities or engineering schools to achieve better understanding of the recent theories on structural concrete. Having these targets in mind, the General Assembly of CEB decided already in 1995 to set up a Special Activity Group Dissemination of Knowledge to realise that work. The authors invited to draft the different chapters had been mostly involved already in drafting the Model Code 90. In this way, consistent information could be provided both for the code and the textbook. Each chapter has been thoroughly discussed and commented within the Special Activity Group 2. This textbook was first presented to fib members during the Technical Activity Workshop in October 1999 in Prague, held in connection with the first fib symposium. The authors are looking forward to receiving comments from various corners.

Structural Health Monitoring of Large Structures Using Acoustic Emission-Case Histories Kanji Ono, Tomoki Shiotani, Martine Wevers, Marvin A. Hamstad, 2020-11-23. Acoustic emission (AE) techniques have successfully been used for assuring the structural integrity of large rocket motorcases since 1963 and their uses have expanded to ever larger structures, especially as structural health monitoring (SHM) of large structures has become the most urgent task for engineering communities.

around the world The needs for advanced AE monitoring methods are felt keenly by those dealing with aging infrastructures Many publications have appeared covering various aspects of AE techniques but documentation of actual applications of AE techniques has been mostly limited to reports of successful results without technical details that allow objective evaluation of the results There are some exceptions in the literature In this Special Issue of the Acoustics section of Applied Sciences we seek contributions covering these exceptions cited here Here we seek contributions describing case histories of AE applications to large structures that have achieved the goals of SHM by providing adequate technical information supporting the success stories Types of structures can include aerospace and geological structures bridges buildings factories maritime facilities off shore structures etc Experiences with AE monitoring methods designed and proven for large stru
