Steel-Reinforced Concrete Structures Mohamed El-Reedy, 2007-10-22 A Practical Guide to Maintenance Carrying a billion dollar price tag corrosion of reinforced concrete is the enemy of every country's investment in real estate The widespread and long term use of reinforced concrete makes its correct and proper examination maintenance and repair paramount Steel Reinforced Concrete Structures

Basic Principles of Concrete Structures Xianglin Gu, Xianyu Jin, Yong Zhou, 2015-12-09 Based on the latest version of designing codes both for buildings and bridges GB50010 2010 and JTG D62 2004 this book starts from steel and concrete materials whose properties are very important to the mechanical behavior of concrete structural members Step by step analysis of reinforced and prestressed concrete members under basic loading types tension compression flexure shearing and torsion and environmental actions are introduced The characteristic of the book that distinguishes it from other textbooks on concrete structures is that more emphasis has been laid on the basic theories of reinforced concrete and the application of the basic theories in design of new structures and analysis of existing structures Examples and problems in each chapter are carefully designed to cover every important knowledge point As a basic course for undergraduates majoring in civil engineering this course is different from either the previously learnt mechanics courses or the design courses to be learnt Compared with mechanics courses the basic theories of reinforced concrete structures cannot be solely derived by theoretical analysis And compared with design courses this course emphasizes the introduction of basic theories rather than simply being a translation of design specifications The book will focus on both the theoretical derivations and the engineering practices

Sustainable Light Concrete Structures Kristian Dahl Hertz, Philip Halding, 2021-10-21 The book presents new technologies for easy and economical construction of light concrete structures saving materials and CO₂ The new super light technology allows a designer to place forces where it is optimal and save material everywhere else The book also supports this Direct Engineering principle with a number of new details and structural principles The new pearl chain technology makes it possible to design optimal shapes such as arches vaults cupolas floating tunnels and shells etc from inexpensive and mass produced components The new super light deck elements presented in the book are now produced in six factories in Denmark Finland and USA and the number is increasing The book will be of interest for all structural engineers who would like to save materials CO₂ and optimize their structures for students learning about the new technologies and for contractors and architects who want to investigate new building technologies

2022 fib Awards for Outstanding Concrete Structures FIB - International Federation for Structural

Concrete, 2022-06-15 The fib has two major missions now. One is to work toward the publication of the Model Code 2020 and the other is to respond to the global movement toward carbon neutrality. While the former is steadily progressing toward completion, the latter will require significant efforts for generations to come. As we all know, cement, the primary material for concrete, is a sector that accounts for 8.5% of the world's CO₂ emissions. And the structural concrete that fib handles consumes 60% of that. In other words, we need to know the reality that our structural concrete is emitting 5% of the world's CO₂. From now on, fib members, suppliers, designers, builders, owners, engineers, and academic researchers will be asked how to solve this difficult problem. In general, most of the CO₂ emissions in the life cycle of structural concrete come from the production stage of materials and the use stage after construction, i.e., A1 to A3 and B1 to B5 processes as defined in EN15978. Cement and steel sectors, which are the main materials for structural concrete, are expected to take various measures to achieve zero carbon in their respective sectors by 2050. Until then, we must deal with the transition with our low carbon technologies. Regarding the production stage, the fib has recently launched TG4.8 Low carbon concrete. And the latest low carbon technologies will be discussed there. On the other hand, in the use stage, there is very little data on the relationship between durability and intervention and maintenance so far. The data accumulation here is the work of the fib, a group of various experts on structural concrete. Through life management using highly durable structures and precise monitoring, we will be able to realize minimum maintenance in the use stage and to minimize CO₂ emissions. Furthermore, it is also possible to contribute to the reduction of CO₂ emissions in the further stage after the first cycle by responding to the circular economy that is deconstruction, C reuse and recycle, D. However, the technology in this field is still in its infancy, and further research and development is expected in the future. As described above, structural concrete can be carbon neutral in all aspects of its conception, and it can make a significant contribution when it is realized. The fib will have to address these issues in the future. Of course, it will not be easy, and it will take time. However, if we do not continue our efforts as the only international academic society on structural concrete in the world to achieve carbon neutrality, the significance of our very existence may be questioned. Long before Portland cement was invented, Roman concrete, made of volcanic ash and other materials, was the ultimate low carbon material and is still in use 2,000 years later because of its non-reinforced structure and lack of deterioration factors. Reinforced concrete, which made it possible to apply concrete to structures other than arches and domes, is only 150 years old. Prestressed concrete is even younger, with only 80 years of history. Now that we think about it, we realize that Roman concrete, which is non-reinforced low carbon concrete, is one of the examples of problem solving that we are trying to achieve. We have new materials such as coated reinforcement FRP and fiber-reinforced concrete, which can be used in any structural form. To overcome this challenge with all our wisdom would be to live up to the feat the Romans accomplished 2,000 years ago. Realizing highly durable and elegant structures with low carbon concrete is the key to meet the demands of the world in the future. I hope you will enjoy reading this AOS brochure showing the Outstanding Concrete

Structures Awards at the fib 2022 Congress in Oslo And I also hope you will find some clues for the challenges we are facing
