Radioimmunotherapy also known as systemic targeted radiation therapy uses antibodies antibody fragments or compounds as carriers to guide radiation to the targets It is a topic rapidly increasing in importance and success in treatment of cancer patients This book represents a comprehensive amalgamation of the radiation physics chemistry radiobiology tumor models and clinical data for targeted radionuclide therapy It outlines the current challenges and provides a glimpse at future directions With significant advances in cell biology and molecular engineering many targeting constructs are now available that will safely deliver these highly cytotoxic radionuclides in a targeted fashion A companion website includes the full text and an image bank *Targeted Radionuclide Tumor Therapy* Torgny Stigbrand, Jorgen Carlsson, Gregory P.

Adams, 2008-09-01 The last three decades have provided opportunities to explore the potential of treating malignant diseases with antibodies or other targeting molecules labelled with nuclides While considerable advances have been reported there is still a significant amount of work left to accomplish before our ambitions can be achieved It now seems timely to review the accomplishments achieved to date and to clarify the challenges that remain The choice of radionuclide the conjugation procedure employed and the selection of suitable targets were early issues that were faced by our field that still persist however we can now tackle these obstacles with significantly better insight The expanding array of new targeting molecules recombinant antibodies peptides and agents based upon alternate scaffolds may increase the therapeutic efficacy or even modify the radiation sensitivity of the targeted tumor cell The title of this book *Targeted Radionuclide Tumour Therapy Biological Aspects* was selected to reinforce the concept that a major focus of this volume was devoted to understanding the biological effects of targeting and radiation These important issues have not previously been the primary focus in this context Furthermore our rapidly expanding knowledge of different types of cell death and the increasingly likely existence of cancer stem cells suggests to us that even more efficient approaches in targeting might be possible in the future Concepts and

Misconceptions of Drug Targeting Karel Petrak, 2020-08-05 Precision medicine requires precision drugs that match the needs of individual patients An ideal drug popularly referred to as the magic bullet should be effective without causing any unwanted side effects To do this drugs must act solely on the target of the disease Despite major efforts in this area over some 50 years the currently available drugs are far from being ideal This book summarizes the key requirements for developing precision drugs and offers a new paradigm for site specific drug delivery As such it will be of interest to personnel involved in drug development at pharmaceutical and biotech companies and academic institutions **Clinical Applications of Nuclear Medicine Targeted Therapy** Emilio Bombardieri, Ettore Seregini, Laura Evangelista, Carlo Chiesa, Arturo

Patient derived organoids were the subject of next chapter. The subsequent chapters are focused on research methods and new targets in vitro models and energy metabolism in cancer research. Advances in biomedical imaging modalities including nuclear medicine and PET imaging for cancer research and diagnostics are explained in other chapters. Finally strength of biomaterials and nanomedicines in cancer research are discussed in final chapters. This is the main concept of Cancer Immunology Project CIP which is a part of Universal Scientific Education and Research Network USERN. This interdisciplinary book will be of special value for those who wish to have an update on cancer research methods and diagnosis.

Molecular Markers and Targeted Therapy for Hepatobiliary Tumors, volume I. A Yunfei Xu, Zongli Zhang, Hongda Liu, Xuesong Gu, 2024-07-26. Hepatobiliary tumor mainly including hepatocellular carcinoma, cholangiocarcinoma and gallbladder cancer is a group of highly aggressive malignancies. Hepatocellular carcinoma, cholangiocarcinoma and gallbladder cancer have different biological characters, histopathological traits and treatment strategies but have similar clinical features such as silent early symptom and extremely poor prognosis. The diagnostic, predictive or prognostic tumor biomarkers of hepatobiliary cancers are in unmet need. In contrast to the poor outcome, the treatment options to hepatobiliary cancers are very limited. It is still controversial about the effects of chemotherapy and radiotherapy of hepatobiliary cancer. FDA approved targeted drugs are only Sorafenib and Lenvatinib for hepatocellular carcinoma and Pemigatinib for cholangiocarcinoma. Unfortunately, these drugs are only effective for 5%–30% patients. Therefore, more attention should be called upon on investigating effective biomarkers and drug targets stratifying high risk patients, guiding precise treatments and developing therapeutic strategies for hepatobiliary cancers. This Research Topic aims at discussing the current knowledge and proceedings of diagnostic, predictive and prognostic tumor biomarkers in hepatobiliary cancer and presenting the recent advances on new drug targets and potential targeted therapies of hepatobiliary cancer. We welcome submissions of Review, Mini Review, Clinical Trial and Original Research articles covering but not limited to the following topics: 1. new diagnostic, prognostic factors, biomarkers and/or risk factors in hepatobiliary tumors; 2. new drug targets and oncogenic or tumor suppressive molecular mechanism of the novel targets; 3. new intervention or targeted therapy in hepatobiliary tumors; 4. new findings of bioinformatics or high throughput methods such as mass spectrometry and genome wide association studies or which may help screen the potential biomarkers of hepatobiliary tumors; 5. clinical studies such as cohort study or RCT to identify new risks or treatment therapies in hepatobiliary tumors; 6. basic pharmacological, preclinical or clinical study of potential drugs targeting hepatobiliary tumors. Please note manuscripts consisting solely of bioinformatics or computational analysis of public genomic or transcriptomic databases which are not

accompanied by validation independent cohort or biological validation in vitro or in vivo are out of scope for this section and will not be accepted as part of this Research Topic

Cancer is a complex adaptive dynamic system that causes both local and systemic failures in the patient Cancer is caused by a number of gain of function and loss of function events that lead to cells proliferating without control by the host organism over time In cancer the immune system modulates cancer cell population heterogeneity and plays a crucial role in disease outcomes The immune system itself also generates multiple clones of different cell types with some clones proliferating quickly and maturing into effector cells By creating regulatory signals and their networks and generating effector cells and molecules the immune system recognizes and kills abnormal cells Anti cancer immune mechanisms are realized as multi layer nonlinear cellular and molecular interactions A number of factors determine the outcome of immune system tumor interactions including cancer associated antigens immune cells and host organisms
