

Naturally clean

After 10 years, the unusual approach that Walnut Cove took toward treating its wastewater has proven to be an idea ahead of its time. Here is how it works:

A wetland system

1 Untreated wastewater is pumped in and flows by gravity through a distribution box
2 into a large lake where it's sprayed through nozzles 3 in order to expose it to the air and add oxygen. From there it enters a second large aeration pond 4, where microorganisms continue to digest the sewage as the water flows slowly into and through the serpentine ponds 5, giving microbes plenty of time to work. At another distribution box 6, operators can use different size gates to control flows as the water enters ponds filled with cattails 7, which finish the natural filtering process. After plant material is screened out 8, the water fills a contact basin 9, where chlorine gas is added to kill any remaining harmful bacteria 10 before being exposed to sulfur dioxide gas to neutralize the chlorine. The now crystal clear water passes through a final filter 11, where the amount of water leaving the system is measured and samples are gathered to ensure the water is safe as it flows toward nearby Town Fork Creek.

Alternative Wastewater Treatment A.S. Eikum,R.W. Seabloom,2012-12-06 Following the end of World War II there was a major migration of population in the United States and Scandinavian countries to urban areas As a result of this migration and in part due to the public works moratoria imposed during the war a major program of sewer construction was instigated which resulted in the collection and subsequent concentration of large volumes of waste water at single discharge points As the assimilative capacity of these receiving waters was exceeded it led to or aggravated existing water pollution problems in these waters To mitigate this degradation of water quality a massive program to construct wastewater treatment facilities was instigated In addition large amounts of money were spent on research to improve the technology of the conventional collection and treatment concept In contrast the wastewater disposal problem of the rural home owner received little attention and in most cases the septic tank soil absorption system ST SAS was the interim solution In recent years there has been a fundamental change in the population growth pattern in the US and Scandinavian countries It appears that a great many people are moving back to rural areas where they seem to prefer the suburban or small town environment yet at the same time want all the conveniences of urban life The provision of proper wastewater disposal facilities presents a very perplexing problem because the capital and operating costs of conventional sewers are usually financially impractical for rural areas
