SAN Boot Implementation and Best Practices Guide for IBM System Storage Sangam Racherla,Delmar

Demarchi,Scott Dybas,Bobby Stark,Mansoor Syed,IBM Redbooks,2012-09-30 Booting servers from a storage area network

SAN is being used increasingly in complex data center environments today due to its significant benefits over the traditional method of booting from local disks SAN Boot enables organizations to maximize consolidation of their IT resources minimize their equipment costs and realize the considerable management benefits of centralizing the boot process In SAN Boot you can deploy diskless servers in an environment where the boot disk is located on often RAID capable storage connected to the SAN The server initiator communicates with the storage device target through the SAN using the Fibre Channel host bus adapter HBA The system downtime is greatly minimized in case a critical component such as a processor memory or host bus adapter fails and needs to be replaced The system administrator needs to swap only the hardware and reconfigure the HBA s BIOS switch zoning and host port definitions on the storage server The system image still exists on the logical drive therefore the server is fully operational after the hardware swap and configuration change is completed This IBM Redbooks publication can help you with the SAN Boot implementation We present various SAN Boot scenarios using IBM System Storage products that include DS5000 DS8000 XIV and SVC The operating systems that are covered include Windows 2008 Red Hat Linux SUSE Linux and VMware

Database Architecture Design - Memory to Storage using DB2 Lawrence Dunn, 2016-04-14 It continues to amaze me on the number of corporations running data based applications on DB2 who view it as a black box that simply houses their application data This disconnect with the importance of properly designed and more importantly configured data bases leads to application error lowered customer satisfaction drastically decreased potential being proactive with KPI s and increased hardware and support costs This disconnect is so prevalent that many organizations assume that the solution to a badly performing database is adding a score of new indexes buying more memory or worse going through a massive conversion upgrade effort with a new product Capital expenditure on additional memory and storage for a database that simply needs to be properly configured for its workload is something that I see various companies do every year and it s a massive waste of shareholder equity In a previous life I was responsible for capacity planning with Procter Gamble s technical infrastructure Following the Pareto Principle i e 80 20 rule the first thing that I did was identify which portion of the infrastructure was responsible for the highest costs in support licensing and new expenditures Three IBM 3090 mainframes jumped out with the highest costs so I initially placed my focus there Looking at daily workloads of each environment what became apparent was that the utilization between each machine ran a little over 40% This was a massive waste of resources So I simply rebalanced the workload dividing processing between two machines and eliminating the third This simple act of effectively spreading workload utilization saved P G 2M year The workload within a DB2 database can also be effectively spread with an effective buffer pool and storage strategy This will drastically improve overall performance eliminating the need to acquire additional memory and lowering support costs I ve been in numerous pre sales situations where a client will sign a contract to purchase a data based application and as the ink is drying they will then ask architecture questions that they should have addressed beforehand What type of DB2 license should we buy How much memory will we need How much storage What kind of storage How many LUNs will we need to configure How many CPU s will we need

These are all very relevant questions that should be addressed before making the decision to purchase a shiny new data based application. However, in my experience, the key after the fact question that is rarely asked is: What type of performance should I expect? In my experience, performance is seldom discussed during project startup but it is always brought up once the application is in production. The issue, as I stated earlier, is that many technical professionals view DB2 as a black box in that they are only concerned with space. With this fixated view, they look at the potential size of the database to figure out how much storage to purchase. Then the storage size is used to guesstimate the amount of memory and CPU that should be required. The assumption is made that adequately estimating hardware based on database size will also equate into having adequate performance. This is a woefully inadequate assumption that will lead to subpar performance in your production environment. This white paper will illustrate via a case study the benefits of completing a database architecture design as one of the first project deliverables that contains the database configuration parameters, bufferpool design, tablespace design, LUN design, and device file design. This will ensure optimal database performance and low capital expenditures for your project.

IBM TS7760 R4.2 Cloud Storage Tier Guide Sosuke Matsui, Derek Erdmann, Nobuhiko Furuya, Rin Fujiwara, Joe Hew, Tomoaki Ogino, Alberto Barajas Ortiz, Michael Scott, Joe Swingler, Taisei Takai. Larry Coyne, IBM Redbooks, 2019-06-14. Building on over 20 years of virtual tape experience, the TS7760 now supports the ability to store virtual tape volumes in an object store. This IBM Redpaper publication helps you set up and configure the new cloud object storage support for IBM Cloud Object Storage COS or Amazon Web Services AWS. The TS7700 supported offloading to physical tape for over two decades. Offloading to physical tape behind a TS7700 is used by hundreds of organizations around the world. By using the same hierarchical storage techniques, the TS7700 can also offload to object storage. Because object storage is cloud based and accessible from different regions, the TS7760 Cloud Storage Tier support essentially allows the cloud to be an extension of the grid. In this IBM Redpaper publication, we provide a brief overview of cloud technology with an emphasis on Object Storage. Object Storage is used by a broad set of technologies, including those technologies that are exclusive to IBM Z. The aim of this publication is to provide a basic understanding of cloud Object Storage and different ways it can be integrated into your environment. This Redpaper is intended for system architects and storage administrators with TS7700 experience who want to add the support of a Cloud Storage Tier to their TS7700 solution.

IBM XIV Storage System with the Virtual I/O Server and IBM i Bertrand Dufrasne, Roger Eriksson, Jana Jamsek, IBM Redbooks, 2012-02-20. This IBM Redpaper™ publication explains how you can connect the IBM XIV Storage System server to the IBM i operating system through the Virtual I/O Server VIOS. A connection through the VIOS is especially of interest to IT centers that have many small IBM i partitions. When using the VIOS, the Fibre Channel host adapters can be installed in the VIOS and shared by many IBM i clients by using virtual connectivity to the VIOS. This paper also includes guidance for sizing XIV logical unit numbers (LUNs) when attached to the IBM i client.
