Water Robin Clarke, 2013-12-16 Only 3 per cent of the world s water is freshwater and about one third of that is inaccessible The rest is very unevenly distributed parts of Canada and the Amazon for example are both more than amply supplied Terrible and permanent water stress can be seen among other places in the drylands of Africa caused not just by drought but by poverty leading to poor land management and over population As with so many other things those most badly affected are the poor nations of the world who are frequently faced with an impossible dilemma they must either limit their water use to decreasingly available unused water or they must make do with used but untreated and therefore dangerous water They cannot afford the technology to recycle safely In rural regions increased populations and frequent droughts mean that in addition to the lack of fresh clean water for human consumption there are inadequate supplies for crop irrigation An enormous proportion of the world s population lives in countries which share their primary sources of water with other nations for example 12 countries depend on the Danube 10 on the Niger 9 on the Nile Water is essential to development both in poor countries and in rich the use made of a major river in one country can affect seriously the possibilities open to another Hence the international shortage is a major threat to world security To take but one example if Turkey goes ahead with its plan to dam the Euphrates then Iraq and Syria already water stressed countries could be in even more serious trouble they are hardly likely to accept the situation This book describes the world situation addresses the nature of the problems shows the ways in which they have been shamefully neglected in all development and economic thinking and proposes some solutions often simple and well tried but which could ensure water security for the whole world

Bhaswati Ray,Rajib Shaw,2018-12-30 This book presents water insecurity issues in urban areas while developing a water security index and explores the innovative approaches to water development and management with examples from Asian cities The urban water crisis is a global phenomenon but it is more obvious in the megacities of the developing world Urban drought although not a familiar term will pose a significant threat to humankind in the near future especially in the context of increasing population in cities Many cities are already unable to provide safe clean water for their citizens Some of the world s largest cities depend heavily on groundwater for their water supply It is unlikely that dependence on aquifers which take many years to recharge will be sustainable As urban populations grow water use will need to shift from agriculture to municipal and industrial uses making decisions about allocating between different sectors difficult Inefficient water use practices by households and industries fragmented management of water between sectors and institutions climate induced water shortages environmental degradation of water sources and inadequate use of alternate sources are also issues of major concern Despite recent advances in the literature there exists a considerable gap in attempting an integrated water resource management approach Covering all aspects of urban drought and water insecurity this book is a valuable resource for students researchers academics policy makers and development practitioners **Water Crises and Sustainable**
