Willert-Porada, 2007-05-17 Prometheus brought fire to mankind Arthur R von Hippel Dielectrics and Waves 1954 Our contribution There are only few areas of research and development of a comparable scientific and technological extension as microwave and high frequency processing Processing means not only application of radiation of 300 MHz to 300 GHz frequency to synthesis heating or ionisation of matter but also generation transmission and detection of microwave and radio frequency radiation Microwave and high frequency sources positioned in the orbit are the foundation of modern satellite telecommunication systems gyrotron tubes being presently developed in different countries all over the world will most probably be the major devices to open up a new era of energy supply to mankind by means of fusion plasma Although initiated by military purposes during the Second World War RADAR Radio Detection and Ranging microwave and high frequency utilisation has spread over almost every important aspect of normal day life since then from individual mobile phones and kitchen microwave ovens to industrial food processing production of composites as sustainable building materials green chemistry medical applications and finally infrastructure installations like GPS and Galileo to name only a few examples These different areas of microwave and high frequency radiation application can not be unified within one group of scientists and technologists There are several distinguished communities active e.g. in the area of telecommunication systems strong microwaves for fusion plasma or plasma based materials processing

Handbook of Downstream Processing E. Goldberg, 2012-12-06 The last two decades have seen a phenomenal growth of the field of genetic or biochemical engineering and have witnessed the development and ultimately marketing of a variety of products typically through the manipulation and growth of different types of microorganisms followed by the recovery and purification of the associated products The engineers and biotechnologists who are involved in the full scale process design of such facilities must be familiar with the variety of unit operations and equipment and the applicable regulatory requirements This book describes current commercial practice and will be useful to those engineers working in this field in the design construction and operation of pharmaceutical and biotechnology plants It will be of help to

the chemical or pharmaceutical engineer who is developing a plant design and who faces issues such as Should the process be batch or continuous or a combination of batch and continuous How should the optimum process design be developed Should one employ a new revolutionary separation which could be potentially difficult to validate or use accepted technology which involves less risk Should the process be run with ingredients formulated from water for injection deionized water or even filtered tap water Should any of the separations be run in cold rooms or in glycol jacketed lines to minimize microbial growth where sterilization is not possible Should the process equipment and lines be designed to be sterilized in place cleaned in place or should every piece be broken down cleaned and autoclaved after every turn

Grains Fuji Jian, Digvir S. Jayas, 2021-12-23 Drying and storage are two significant unit operations in the food industry and are applied to both raw and processed products including cereal grains oilseeds legumes flour noodle coffee and cornstarch The common characteristic of these materials is that all of them are hygroscopic and contain water The hygroscopic properties are influenced by their physical properties which are influenced by their storage environments such as bins warehouses bunkers and temporary storage structures This book focuses on the storage and drying of bulk products in these storage structures On many occasions in our work with the grain storage and drying personnel especially our graduate students and industry contacts we found a book explaining the fundamental principles of grain storage and drying is needed Therefore the primary objective of this book is to help readers understand the fundamental principles of grain storage and drying and develop a well informed approach to solve grain storage and drying problems Technologies for grain storage and drying are advanced through research therefore literature review and background on each topic has also been included The book is generally intended for grain storage and drying students engineers and scientists As reflected in the contents which are presented at several levels of depth this book will serve well readers with different backgrounds and interests An effort has been made to allow for independent reading of different sections and to make a large part of this work accessible to a non mathematical audience The authors have combined their experience of teaching grain storage and drying to undergraduate and graduate students in the faculties of Agricultural and Food Sciences and Engineering Material in the book is organized into broad topic areas physical properties Chapters 1 and 2 grain temperature and moisture Chapters 2 and 6 water in biomaterials and relationship with its environment Chapter 3 fundamental principles of aeration drying and rewetting Chapter 4 and mathematical modelling of isotherm drying and re wetting Chapter 5 We hope our readers will benefit from the contents of the book for many decades

A Novel Approach to Sludge Treatment Using Microwave Technology Eva Kocbek, 2022-02-28 Sludge transportation costs can represent a large fraction of the expenses associated with municipal and faecal sludge management These costs can be mitigated through the use of thermal drying approaches to reduce the sludge volume This thesis described the application of a novel microwave based pilot scale unit as an alternative technology for the sanitisation and drying of sludge from municipal wastewater treatment plants and on site sanitation facilities The potential

economic benefits of volumetric heating moisture levelling and increased liquid and vapour migration from the interior to the surface of the product underpins the increasing interest in the use of microwave technology during sludge treatment processes According to the findings of this study these factors lead to faster processing times improved drying rates and a reduced physical footprint Furthermore microwave technology operates as a standalone treatment unit When coupled with mechanical dewatering techniques and membrane separation technology it can increase the reliability of the technology employed in the treatment of sludge while recovering valuable resources through an agricultural or thermochemical application such as co combustion The results of this work demonstrate the strong feasibility of applying microwave based technology within initiatives designed to protect the environment and safeguard public health **Handbook of Industrial**
