Multi-agent Systems for Container Terminal Management Lawrence Edward Henesey,2006 *Design and Operation of Automated Container Storage Systems* Nils Kemme,2012-11-07

The storage yard is the operational and geographical centre of most seaport container terminals Therefore it is of particular

importance for the whole terminal system and plays a major role for trade and transport flows One of the latest trends in container storage operations is the automated Rail Mounted Gantry Crane system which offers dense stacking and offers low labour costs This book investigates whether the operational performance of container terminals is influenced by the design of these storage systems and to what extent the performance is affected by the terminal s framework conditions and discusses the strategies applied for container stacking and crane scheduling A detailed simulation model is presented to compare the performance effects of alternative storage designs innovative planning strategies and other influencing factors The results have useful implications future research practical terminal planning and optimisation **Computational Logistics** Jürgen

W. Böse,Hao Hu,Carlos Jahn,Xiaoning Shi,Robert Stahlbock,Stefan Voß,2011-09-25 This book constitutes the refereed proceedings of the Second International Conference on Computational Logistics ICCL 2011 held in Hamburg Germany in September 2011 The 26 revised full papers presented were carefully reviewed and selected from numerous submissions The papers are organized in topical sections on transport services logistics systems and production and maritime shipping and container terminals Container Handling in Automated Yard Blocks Filip Covic,2019-01-28 The yard block of a container

terminal is the central point of synchronisation for asynchronous container flows between deep sea vessels and transport to the hinterland The structure of the block stipulates that containers are stacked on top of each other with only the topmost container directly accessible by a yard crane This book describes a holistic and integrative approach to container handling in yard blocks to optimise productivity by minimising re handling operations The results provide insights for academic scholars as well as for experts from practical terminal planning and operations The approach presented is two fold first a theoretical foundation of the interdependencies in decision making is established using mathematical programming Secondly operations involving uncertain container arrival information are examined on the basis of a simulation with a rigorous experimental design and statistical evaluation In this context the book develops container handling strategies and analyses the impact of a system for vehicle arrival management the Terminal Appointment System The findings presented in this book are the result of a close cooperation with experts at the port of Hamburg and build on previous research Computational Logistics Tolga
