Context in Communication: A Cognitive View Gabriella

Airenti,Marco Cruciani,Alessio Plebe,2017-04-03 Context is what contributes to interpret a communicative act beyond the spoken words It provides information essential to clarify the intentions of a speaker and thus to identify the actual meaning of an utterance A large amount of research in Pragmatics has shown how wide ranging and multifaceted this concept can be Context spans from the preceding words in a conversation to the general knowledge that the interlocutors supposedly share from the perceived environment to features and traits that the participants in a dialogue attribute to each other This last category is also very broad since it includes mental and emotional states together with culturally constructed knowledge such as the reciprocal identification of social roles and positions The assumption of a cognitive point of view brings to the foreground a number of new questions regarding how information about the context is organized in the mind and how this kind of knowledge is used in specific communicative situations A related very important question concerns the role played in this process by theory of mind abilities ToM both in typical and atypical populations In this Research Topic we bring together articles that address different aspects of context analysis from theoretical and empirical perspectives integrating knowledge and methods derived from Philosophy of language Linguistics Cognitive Science Cognitive Neuroscience Developmental and Clinical Psychology

Language and Context Helen Leckie-Tarry, 1995-06-01 Language and Context breaks new ground in our understanding of the relationship between register, genre, and context. Leckie-Tarry argues convincingly and engagingly for a functional theory of language, which specifies register in terms of contextual and linguistic features, and which suggests a discursive relationship between the two. Moving beyond the limits of much of today's theory, this accessible volume develops a theoretical understanding of the relationship between text, context, language function, and linguistic form. Helen Leckie-Tarry, a specialist in the area of register and applied linguistics, died in 1991, aged 49. Although she had finished

Neuroscience has largely abandoned its localizationist and mechanistic framework of the 20th century The plastic embodied and network character of our nervous system is widely acknowledged and systems theory approaches to consciousness dominate the field However the underlying neuron theory has not changed The neuron doctrine conceptualizing the single neuron as atomistic one directional source of neural function still provides the template for our understanding of these basic elements of our nervous system and the material foundation of consciousness Yet the single neuron does not exist as an isolated unit It is embedded within multiple cellular structural and functional contexts and highly depends on them for its development neural activity and survival The book discusses the constraints of the neuron doctrine and its pragmatic reductionism in the light of the growing knowledge about the brain s connectivity plasticity and systemic and embodied nature To overcome these constraints the author argues for a new neuron theory depicting the neuron as bidirectional hub which is at the same time source and product of neural function This bidirectionality is further characterized by spatial and time dimensions placing the neuron within a multi level pathway model of psychobiological development from the perspective of Developmental Embodiment Research Furthermore the author discusses the potential of neuroepigenetic markers to characterize the neuron and its range of plasticity within this developmental perspective With its focus on neuroepigenetics the book addresses a knowledge gap in the current study of the neural foundations of psychological functions The multi level and bidirectional perspective is already realized in approaches coming from developmental systems theory which model neural function at the connectome

level and it also fits with approaches investigating feedback loops underlying neural activity at the single cell level. At both these levels the spatial and the time dimensions are well characterized either as changing connectivity patterns across different age groups or as synaptic feedback loops underlying neural activation patterns. However for the intermediate level of small neural populations which is currently the main target for studies investigating the neural basis of specific psychological functions this characterization turned out to be more challenging. Multi cell recordings have provided a first glimpse into the complex interaction patterns of these small neural networks but they are limited to the recording period and do not provide information about the long term developmental and activation history. Here neuroepigenetic markers could be of use. Due to their relative stability and at the same time environmental sensitivity neuroepigenetic markers represent an additional layer of information in which to a certain degree the cell's metabolic and activation history is aggregated over time. This information is available at the single neuron level but could also be modeled as aggregated information for small neural populations and the supporting cellular context. Looking through this epigenetic lens adds to our understanding of the neuron as bidirectional hub by emphasizing the molecular correlates of functional stabilization and their contextual prerequisites. These prerequisites reach from the immediate cellular context to the social cultural contexts which shape the culturally specific modes of acquisition of psychological functions throughout the lifespan. Accounting for this multilayered contextuality of the neuron and its function affords to reposition the relationship between neuroscience and psychology in their joint effort to unravel the material basis of consciousness. This provides new challenges but also new perspectives for theoretical psychology. The book presents these current developments and debates to researchers, graduate students and interested professionals and practitioners working in neuroscience, epigenetics, psychiatry, psychology and psychotherapy. It also provides a basic introduction into neuroepigenetics, its mechanisms and first findings for graduate students as well as interested professionals and practitioners working in psychiatry, psychology and psychotherapy.

Social Knowledge Management in Action Remko Helms, Jocelyn Cranefield, Jurriaan van Reijssen, 2017-02-23

Knowledge management (KM) is about managing the lifecycle of knowledge consisting of creating, storing, sharing and applying knowledge. Two main approaches towards KM are codification and personalization. The first focuses on capturing knowledge using technology and the latter on the process of socializing for sharing and creating knowledge. Social media are becoming very popular as individuals and also organizations learn how to use it. The primary applications of social media in a business context are marketing and recruitment. But there is also a huge potential for knowledge management in these organizations. For example, wikis can be used to collect organizational knowledge and social networking tools which leads to exchanging new ideas and innovation. The interesting part of social media is that by using them one immediately starts to generate content that can be useful for the organization. Hence they naturally combine the codification and personalisation approaches to KM. This book aims to provide an overview of new and innovative applications of social media and to report challenges that need to be

solved One example is the watering down of knowledge as a result of the use of organizational social media Von Krogh 2012
