**The Century of Space Science** J.A. Bleeker, Johannes Geiss, M. Huber, 2012-12-06 One of the most attractive features of the young discipline

of Space Science is that many of the original pioneers and key players involved are still available to describe their field. Hence at this point in history we are in a unique position to gain first hand insight into the field and its development. To this end *The Century of Space Science* a scholarly authoritative reference book presents a chapter by chapter retrospective of space science as studied in the 20th century. The level is academic and focuses on key discoveries how these were arrived at their scientific consequences and how these discoveries advanced the thoughts of the key players involved. With over 90 world class contributors such as James Van Allen, Cornelis de Jager, Eugene Parker, Reimar Lüst and Ernst Stuhlinger and with a Foreword by Lodewijk Woltjer past ESO Director General this book will be immensely useful to readers in the fields of space science, astronomy and the history of science. Both academic institutions and researchers will find that this major reference work makes an invaluable addition to their collection.

**Sciences of Geodesy - I** Guochang Xu, 2010-09-09. This series of reference books describes sciences of different fields in and around geodesy with independent chapters. Each chapter covers an individual field and describes the history, theory, objective, technology, development, highlights of research and applications. In addition, problems as well as future directions are discussed. The subjects of this reference book include Absolute and Relative Gravimetry, Adaptively Robust Kalman Filters with Applications in Navigation, Airborne Gravity Field Determination, Analytic Orbit Theory, Deformation and Tectonics, Earth Rotation, Equivalence of GPS Algorithms and its Inference, Marine Geodesy, Satellite Laser Ranging, Superconducting Gravimetry and Synthetic Aperture Radar Interferometry. These are individual subjects in and around geodesy and are for the first time combined in a unique book which may be used for teaching or for learning basic principles of many subjects related to geodesy. The material is suitable to provide a general overview of geodetic sciences for high level geodetic researchers, educators as well as engineers and students. Some of the chapters are written to fill literature blanks of the related areas. Most chapters are written by well known scientists throughout the world in the related areas. The chapters are ordered by their titles. Summaries of the individual chapters and introductions of their authors and co authors are as follows: Chapter 1 Absolute and Relative Gravimetry provides an overview of the gravimetric methods to determine most accurately the gravity acceleration at given locations.

**Optical Communication Theory and Techniques** Enrico Forestieri, 2006-01-26. Since the advent of optical communications a great technological effort has been devoted to the exploitation of the huge bandwidth of optical fibers. Starting from a few Mb/s single channel systems a fast and constant technological development has led to the actual 10 Gb/s per channel dense wavelength division multiplexing (DWDM) systems with dozens of channels on a single fiber. Transmitters and receivers are now ready for 40 Gb/s whereas hundreds of channels can be simultaneously amplified by optical amplifiers. Nevertheless despite such a pace in technological progress optical communications are still in a primitive stage if compared for instance to radio communications the widely spread on off keying (OOK) modulation format is equivalent to the rough amplitude modulation (AM) format whereas the DWDM technique is nothing more than the optical version of the frequency

vision multiplexing FDM technique Moreover adaptive equalization channel coding or maximum likelihood detection are still considered something exotic in the optical world This is mainly due to the favourable characteristics of the fiber optic channel large bandwidth low attenuation channel stability which so far allowed us to use very simple transmission and detection techniques

GPS for Geodesy Peter J.G. Teunissen, Alfred Kleusberg, 2012-12-06 An in depth description of the theory and mathematical models behind the application of the global positioning system in geodesy and geodynamics The contributions by leading experts in the field ensure a continuous flow of ideas and developments The mathematical models for GPS measurements are developed in the first half of the book and these are followed by GPS solutions for geodetic applications on local regional and global scales
