Stephen P. Reidel, Peter R. Hooper, 1989 **The Boundaries of the West African Craton** Nasser Ennih, Jean-Paul Liégeois, 2008 Composition, Deep Structure and Evolution of Continents R.D. van der Hilst, W.F. McDonough, 1999-10-22

The ensemble of manuscripts presented in this special volume captures the stimulating cross disciplinary dialogue from the International Symposium on Deep Structure Composition and Evolution of Continents Harvard University Cambridge Massachusetts 15-17 October 1997. It will provide an update on recent research developments and serve as a starting point for research of the many outstanding issues. After its formation at mid-oceanic spreading centers, oceanic lithosphere cools, thickens and subsides until it subducts into the deep mantle beneath convergent margins. As a result of this continuous recycling process, oceanic lithosphere is typically less than 200 million years old; the global average is about 80 Myr. A comprehensive multi-disciplinary study of continents involves a wide range of length scales: tiny rock samples and diamond inclusions may yield isotope and trace element signatures diagnostic for the formation age and evolution of parts of cratons, while geophysical techniques (e.g. seismic and electromagnetic imaging) constrain variations of elastic and conductive properties over length scales ranging from several to many thousand kilometers. Integrating and reconciling this information is far from trivial, and as several papers in this volume document, the relationships between, for instance, formation age and tectonic behavior on the one hand, and the seismic signature, heat flow and petrology on the other, may not be uniform but may vary both within as well as between cratons. These observations complicate attempts to determine the variations of one particular observable (e.g. heat flow, lithosphere thickness) as a function of another (e.g. crustal age) on the basis of global data compilations and tectonic regionalizations. Important conclusions of the work presented here are that 1) continental deformation, for instance shortening, is not restricted to the crust but also involves the lithospheric mantle; 2) the high wave speed part of continental lithospheric mantle is probably thinner than inferred previously from vertically travelling body waves or from global surface wave models; and 3) the seismic signature of ancient continents is more complex than expected from a uniform relationship with crustal age.

Oceanic Basalts P.A. Floyd, 2012-12-06 Basalt is the most voluminous of all the igneous rocks. Extensive field, experimental, petrographic and geochemical studies of basalt have provided us with a considerable understanding of igneous petrogenesis, plate tectonics and crust-mantle interaction and exchange. One important aspect of geology that has developed over the last few decades is the study of oceanic basalts. The ocean basins cover about two thirds of the Earth's surface and are floored by a basement of oceanic basalt that is continuously undergoing generation at spreading centres and destruction at subduction zones, a process which throughout geological time is recognized as the principal means of generating new crust. The study of oceanic basalts enables us to understand better the generation and recycling of crustal materials, including the continental crust, and the exchange between oceanic crust and seawater via hydrothermal activity. Compositional variations displayed by oceanic basalts provide windows into the mantle, and the identification of isotopically distinct mantle reservoirs demonstrates that the source of oceanic basalts is

heterogeneous and is controlled by convection and reservoir interactions within the mantle

Magmatism in Extensional Structural Settings A.B. Kampunzu, R.T. Lubala, 2012-12-06 The African continent is unique in that it has escaped widespread orogenic activity after the Pan African orogenic event Therefore the African Plate provides the world s best example of the relationship between extensional magmatism and structural setting This first complete and up to date review written by leading scientists discusses the evolutionary model and offers a new and reliable basis for scientists working on plate tectonics and extensional areas in other continents

The Nature of Magmatism in the Appalachian Orogen A. Krishna Sinha, Joseph Bruce Whalen, John P. Hogan, 1997-01-01 The thermal evolution of mountain belts is recorded in the distribution origin and ages of magmatism In this volume petrologic isotopic and geochemical evidence is presented to highlight the contribution of igneous rocks to the evolution of the Appalachian Orogen in both Canada and the United States These papers emphasize the use of modern geochemical and petrologic data to discriminate the sources yielding magmas and thus the nature of the crust and mantle
