**Tissue Oxygen Utilization** Guillermo Gutierrez, Jean L. Vincent, 2012-12-06 Disturbances in peripheral O<sub>2</sub> extraction can be produced in dogs treated with 2 endotoxin and thereby provide an opportunity to test theories for the origin of pathological O<sub>2</sub> supply dependency or to try different treatment modalities The 2 most serious deficiency in the current animal models is the inability to mimic the increased O<sub>2</sub> demand that is observed in patients at O<sub>2</sub> delivery rates in excess of 2 normal A particular feature of this increased O<sub>2</sub> demand is that it apparently does 2 not stimulate increased O<sub>2</sub> extraction although the limitation in O<sub>2</sub> extraction has 2 not been explored in patients by lowering O<sub>2</sub> supply for obvious reasons At least two possibilities to account for increased O<sub>2</sub> demand could be investigated in animal models however The amount of O<sub>2</sub> that is utilized in extramitochondrial pathways which is normally on the order of 10% may be greatly increased in ARDS and sepsis by O<sub>2</sub> radical formation There is presently no information 2 concerning how much O<sub>2</sub> might be used in this way Another strong possibility is that mitochondrial injury perhaps as a result of O<sub>2</sub> radical formation uncouples oxidative phosphorylation Some evidence presently in the literature supports this idea 19 Indeed the association of increased blood lactate levels with higher than expected O<sub>2</sub> demands makes uncoupling a very attractive hypothesis that warrants further investigation in animal models using such agents as 2 4 dinitrophenol References 1
