Contraception and Mechanisms of Endometrial Bleeding Catherine D'Arcangues, 1990 **Endometrial Bleeding and Steroidal Contraception**, 1980 New Mechanisms for Tissue-Selective Estrogen-Free Contraception H.B.

Croxatto, R. Schürmann, U. Fuhrmann, I. Schellschmidt, 2007-01-19 Combined oral contraceptives are the most convenient and accepted method of hormonal contraception. Nevertheless, the medical community and consumers constantly demand innovation, additional benefits during use, and lower hormonal load despite the high safety profile of available products. At the Ernst Schering Research Foundation Workshop 52, new perspectives and mechanisms for tissue-selective estrogen-free contraception were discussed. The aim of the workshop was to bring together experts in the field of molecular and pharmacodynamic action of progestins with clinicians and medical experts to discuss potential medical endpoints, physiological reactions, and bio markers useful in describing the tissue selectivity and the contraceptive action of new progestins in different target organs. A major factor for successful realization of these new concepts is a deeper understanding of local pharmacological responses to progestins in general and to new progestins in particular. **Gynecological Drug Therapy**

During menstruation, the endometrium resembles a bloody wound with a strong inflammatory response. The endometrium is almost unique amongst adult tissues in the rapid resolution of inflammation and restoration of the surface without forming a scar or fibrotic response.
