Contrast Agents II Werner Krause, 2003-07-01 *Contrast Agents II* Werner Krause, 2010-12-04 *Contrast Agents III* Roger Alberto, 2005-02-10 with contributions by numerous experts **MRI Contrast Agents** Sophie Laurent, Céline Henoumont, Dimitri Stanicki, Sébastien Boutry, Estelle Lipani, Sarah Belaid, Robert N. Muller, Luce Vander Elst, 2016-11-03 This book describes the multiple aspects of i preparation of the magnetic core ii the stabilization with different coatings iii the physico chemical characterization and iv the vectorization to obtain specific nanosystems Several bio applications are also presented in this book In the early days of Magnetic Resonance Imaging MRI paramagnetic ions were proposed as contrast agents to enhance the diagnostic quality of MR images Since then academic and industrial efforts have been devoted to the development of new and more efficient molecular supramolecular and nanoparticulate systems Old concepts and theories like paramagnetic relaxation were revisited and exploited leading to new scientific tracks With their high relaxivity payload the superparamagnetic nanoparticles are very appealing in the context of molecular imaging but challenges are still numerous absence of toxicity specificity ability to cross the biological barriers etc Modern Mass Spectrometry Christoph A. Schalley, 2003-07-03 Mass spectrometers are used by almost all chemists and many researchers from neighboring disciplines such as physics medicine or biology as a powerful analytical tool Its advantages are high sensitivity speed and almost no sample consumption During the last two decades mass spectrometry experienced a boom of new developments pushing its limits further and further at an increasing speed just similar to the progress in NMR spectroscopy in the 1970s However a mass spectrometer does not only serve as a machine for solving complicated analytical problems it evolved meanwhile to a complete laboratory for the investigation of molecules clusters and other species under the environment free conditions of the highly diluted gas phase These special conditions existing only in high vacuum change the properties of the particles under study significantly with respect to their energetics and reaction pathways For example temperature is a macroscopic property of a large ensemble of particles in thermal equilibrium and is thus not defined for a single ion This fact has severe implications for the measurement of kinetic and thermodynamic data of gas phase species On the other hand the examination of gas phase properties has the advantage that systems reduced to minimum complexity can be studied more easily without the complicated influences of solvents or counterions In particular the combination of isotopic labeling and mass spectrometry allows for a detailed analysis of reaction mechanisms or conformational analysis through H/D exchange experiments not only on biomolecules **The Chemistry of Molecular Imaging** Nicholas Long, Wing-Tak Wong, 2014-12-31 Molecular imaging is primarily about the chemistry of novel biological probes yet the vast majority of practitioners are not chemists or biochemists This is the first book written from a chemist's point of view to address the nature of the chemical interaction between probe and environment to help elucidate biochemical detail instead of bulk anatomy Covers all of the fundamentals of modern imaging methodologies including their techniques and application within medicine and industry Focuses primarily

on the chemistry of probes and imaging agents and chemical methodology for labelling and bioconjugation First book to investigate the chemistry of molecular imaging Aimed at students as well as researchers involved in the area of molecular imaging
