Control Of Gene Expression By Catecholamines And The Renin Angiotensin System:

Control of Gene Expression by Catecholamines and the Renin-Angiotensin System Heinz Rupp, Bernhard Maisch, 2000-11-30 The special issue of Molecular and Cellular Biochemistry focuses on Control of Gene Expression by Catecholamines and the Renin Angiotensin System in health and disease In recent years great progress has been made in the understanding of catecholamine and angiotensin II modulated gene expression There is also increasing evidence that catecholamine and angiotensin II induced cellular injury not solely arises from classical pathways but also from a perturbed gene expression Taking into account that catecholamines and angiotensin II are vital for a balanced gene expression of many cells the intriguing possibility arises that various disease are initiated or aggravated by such an imbalance Catecholamine and angiotensin II influences can be in excess arising from for example hypercaloric food intake or psychosocial stress During early progression of heart failure sympathetic activity and angiotensin II influences also become increased Due to beta adrenergic receptor downregulation depressed catecholamine influences are expected in the final stage of heart failure An imbalanced influence of catecholamines and angiotensin II on gene expression leads to disordered molecular structures of the cell and an impaired cell function This focused issue is organized into chapters concentrating on catecholamines angiotensin II and the interaction between catecholamines and angiotensin II Basic biochemical processes are covered in detail and the potential of these pathways for explaining chronic diseases associated with excess catecholamine and angiotensin II influences should become apparent It is hoped that this focussed issue triggers novel research into the development of drugs that are targeted at diseases characterized by an imbalanced gene expression involving catecholamines and angiotensin II

Control of Gene Expression by Catecholamines and the Renin-Angiotensin System Heinz Rupp, Bernhard Maisch, 2012-12-06 The special issue of Molecular and Cellular Biochemistry focuses on Control of Gene Expression by Catecholamines and the Renin Angiotensin System in health and disease In recent years great progress has been made in the understanding of catecholamine and angiotensin II modulated gene expression There is also increasing evidence that catecholamine and angiotensin II induced cellular injury not solely arises from classical pathways but also from a perturbed gene expression Taking into account that catecholamines and angiotensin II are vital for a balanced gene expression of many cells the intriguing possibility arises that various disease are initiated or aggravated by such an imbalance Catecholamine and angiotensin II influences can be in excess arising from for example hypercaloric food intake or psychosocial stress During early progression of heart failure sympathetic activity and angiotensin II influences also become increased Due to beta adrenergic receptor downregulation depressed catecholamine influences are expected in the final stage of heart failure An imbalanced influence of catecholamines and angiotensin II on gene expression leads to disordered molecular structures of the cell and an impaired cell function This focused issue is organized into chapters concentrating on catecholamines angiotensin II and the interaction between catecholamines and angiotensin II Basic biochemical processes

are covered in detail and the potential of these pathways for explaining chronic diseases associated with excess catecholamine and angiotensin II influences should become apparent. It is hoped that this focussed issue triggers novel research into the development of drugs that are targeted at diseases characterized by an imbalanced gene expression involving catecholamines and angiotensin II. Pharmacology of Opioid Peptides L F Tseong, 1995-09-01 This book is being published at a time when opioid receptors have recently been cloned. The structural characteristics of opioid receptors and the recent advances in their molecular cloning and expression are explicated. Connecting these cloned opioid receptors with the pharmacology of opioid receptor actions is of particular importance. The use of *Research Awards Index*, 1989

Biomedical Index to PHS-supported Research, 1987 **Cardio-Respiratory Control in Vertebrates** Mogens L. Glass, Stephen C. Wood, 2009-07-24 Hopefully this book will be taken off of the shelf frequently to be studied carefully over many years. More than 40 researchers were involved in this project which examines respiration, circulation and metabolism from sea to the land vertebrates including human beings. A breathable and stable atmosphere first appeared about 500 million years ago. Oxygen levels are not stable in aquatic environments and exclusively water breathing sea must still cope with the ever changing levels of O₂ and with large temperature changes. This is reflected in their sophisticated current systems with high O₂ extraction and internal and external O₂ receptors. The conquest for the terrestrial environment took place in the late Devonian period 355-359 million years ago and recent discoveries portray the gradual transitional evolution of land vertebrates. The oxygen rich and relatively stable atmospheric conditions simplified that oxygen sensing mechanisms were relatively simple and in line compared with acid base regulation. Recently physiology has expanded into related fields such as biochemistry, molecular biology, morphology and anatomy. In the light of the work in these fields the introduction of DNA based cladograms which can be used to evaluate the likelihood of land vertebrates and lung sea as a sister group could explain why their cardio respiratory control systems are similar. The diffusing capacity of a duck lung is 40 times higher than that of a toad or lung sea. Certainly some animals have evolved to high performance levels.

Cumulated Index Medicus, 1984 *Central Neural Mechanisms of Cardiovascular Regulation* KUNOS, CIRIELLO, 2012-12-06 With the help of recent technological advances in the study of central nervous system function, important strides have been made in our knowledge regarding the pathophysiology of high blood pressure. The understanding of neural mechanisms involved in the regulation of the cardiovascular system is of critical importance to the development of rational approaches to both the treatment and prevention of this disease. It was in this spirit that a satellite symposium of the 13th Scientific Meeting of the International Society of Hypertension was held in June 1990 in Bethesda, Maryland. The chapters in this first of two volumes on the same general theme are based on lectures presented at the symposium and it is hoped that these summaries of recent research findings from prominent laboratories around the world will provide a stimulus for future research. The symposium would not have been possible without generous support from the
