The Control of Growth and Differentiation in Plants P. F. Wareing, Irving David James Phillips, 1978 **Growth, Differentiation and Sexuality** Friedhelm Meinhardt, Joseph G.H. Wessels, 2013-04-17 Mycology the study of fungi originated as a subdiscipline of botany and was a descriptive discipline largely neglected as an experimental science until the early years of this century A seminal paper by Blakeslee in 1904 provided evidence for self incompatibility termed heterothallism and stimulated interest in studies related to the control of sexual reproduction in fungi by mating type specificities Soon to follow was the demonstration that sexually reproducing fungi exhibit Mendelian inheritance and that it was possible to conduct formal genetic analysis with fungi The names Burgeff Kniep and Lindegren are all associated with this early period of fungal genetics research These studies and the discovery of penicillin by Fleming who shared a Nobel Prize in 1945 provided further impetus for experimental research with fungi Thus began a period of interest in mutation induction and analysis of mutants for bio chemical traits Such fundamental research conducted largely with *Neurospora crassa* led to the one gene one enzyme hypothesis and to a second Nobel Prize for fungal research awarded to Beadle and Tatum in 1958 Fundamental research in biochemical genetics was extended to other fungi especially to *Saccharomyces cerevisiae* and by the mid 1960s fungal systems were much favored for studies in eukaryotic molecular biology and were soon able to compete with bacterial systems in the molecular arena Biomedical Index to PHS-supported Research ,1990

Principles of Regenerative Medicine Anthony Atala, Robert Lanza, Robert Nerem, James A. Thomson, 2011-04-28 Virtually any disease that results from malfunctioning damaged or failing tissues may be potentially cured through regenerative medicine therapies by either regenerating the damaged tissues in vivo or by growing the tissues and organs in vitro and implanting them into the patient Principles of Regenerative Medicine discusses the latest advances in technology and medicine for replacing tissues and organs damaged by disease and of developing therapies for previously untreatable conditions such as diabetes heart disease liver disease and renal failure Key for all researchers and institutions in Stem Cell Biology Bioengineering and Developmental Biology The first of its kind to offer an advanced understanding of the latest technologies in regenerative medicine New discoveries from leading researchers on restoration of diseased tissues and organs **Research Awards Index** ,1982 Research Grants Index National Institutes of Health (U.S.). Division of Research Grants, 1975 Cumulated Index Medicus ,1989 *Subject Index of Current Extramural Research Administered by the National Cancer Institute* ,1978 **Subject Index of Extramural Research Administered by the National Cancer Institute** ,1979 Current information about research grants and contracts supported by the National Cancer Institute Subject listing gives contract or grant number and topic Investigator grant number and contract number indexes *Stem Cells Handbook* Stewart Sell, 2003-10-22 The power of stem cells for tissue development regeneration and renewal has been well known by embryologists and developmental biologists for many years Those presently active in research in the stem cell

field owe much to previous work by embryologists and cancer researchers for their insights into what stem cells can do In the last 4 5 years the rapid expansion of the concept of adult tissue stem cells as pluripotent progenitors for various tissues has led to an even greater appreciation of the power of stem cells The demonstration that both embryonic and adult tissue stem cells have the ability to produce progenitor cells for tissue renewal has opened vast possibilities for treatment of congenital deficiency diseases as well as for regeneration of damaged tissues Older concepts of determination leading to loss of potential during differentiation of adult tissues are being replaced by newer ideas that cells with multiple potential exist in different forms in various adult organs and that cells thought to be restricted to differentiation to one cell type may be able to transdifferentiate into other tissue cell types Thus the concept of embryonic rests in adult tissues hypothesized to be the cellular origin of cancer by Durante and Conheim in the 1870s now can be expanded to include survival of pluripotential embryonic like stem cells in adult tissues

Advances in Cancer Research ,1995-05-25 ADVANCES IN CANCER RESEARCH is a biannual publication that includes timely reviews on the most cutting edge issues in cancer research Volume 66 contains encompassing overviews of p53 and its role in both breast cancer and in the cell cycle Approximately 50% of all human tumors involve mutations of the p53 gene suggesting that proper understanding of its properties and mechanisms could offer real hope for finding successful clinical therapy Other themes presented in Volume 66 include cyclins and cyclin dependent kinases in the cell cycle Approximately 50% of all human tumors involve mutations of the p53 gene suggesting that proper understanding of its properties and mechanisms could offer real hope for finding successful clinical therapy Other themes presented in Volume 66 include cyclins and cyclin dependant kinases in the cell cycle the molecular genetics of 11q23 chromosome translocations the possible link between the aberrant expression of Scatter Factor and c Met with AIDS Associated kaposi s Sarcoma the use of Radiation Leukemia Virus to induce leukemogenesis and the Adenovirus system as a model for the insertion of foreign DNA into mammalian genomes Also of note in the Foundations of cancer Research section are articles by two prominent cancer researchers recollecting the ideas and paths taken in their lifelong work Paradigms proposed in these reviews mark thoughtful progress toward preventative therapy in oncogenesis and gene therapy of cancer They also cast light on the fact that the ideas presented in these chapters are only the tip of the iceberg in this complex and ever evolving field and suggest many more to come in future volumes Contains two Foundations in Cancer Research articles with personal accounts by prominent biologists on their careers in cancer research Presents overviews of the role of p53 in breast cancer and cell cycle regulation Describes the regulatory role of cyclins and cyclin dependent kinases in DNA replication and cell division Explains

the puzzling link between HIV infection and Kaposi Sarcoma Includes models for retrovirus induced tumorigenesis and foreign DNA insertion into mammalian genomes **Growth Factors and the Cardiovascular System P.**

Cummins,1993-08-31 Nature is totally amoral There are at least 3 4 million people in France alone who suffer from arterial hypertension and whose cardiovascular system is submitted day and night to both a haemodynamic and hormonal stress In all cases the vasculature hypertrophies as does the myocardium This growth process is obviously mainly detrimental at the outset since it lowers compliance of the arteries and makes them stiffer In contrast myocardial hypertrophy is initially beneficial since the growth process multiplies the number of contractile units and by so doing improves external work In addition according to Starling s law wall stress is lowered Growth factors play a major role in this amoral process as a trigger for hypertrophy at the vascular level and very likely at the level of the myocardium Another major point of interest is the role of growth factors as determinants of restenosis after angioplasty and also of atherogenesis Several chapters in this book are directly or indirectly concerned with this problem which is far from being purely academic since several groups are currently trying to control these processes by gene transfer Certainly one of the major clinical questions arising from such studies is why restenosis is not more frequent in clinical practice After de endothelialization the biologist would predict on the basis of recent studies on growth factors and in contrast with current clinical opinion that hypertrophy would occur in all cases with more or less complete restenosis Developmental Biology and Cancer Gisele M. Hodges,Charles Rowlatt,2024-12-20 This

book addresses possible analogies between cancer and developmental biology An international group of experts provides a multidisciplinary approach allowing biological or clinical scientists involved with cancer research to integrate specific information from diverse areas Five concepts of cancer are presented and developmental biology is reviewed at five levels These are integrated in discussions of failure in organisation as a basis of cancer and its control The book will be a valuable reference for both newcomers as well as experienced biological and clinical scientists **The Saga of the Nerve Growth**

Factor Rita Levi-Montalcini,1997 This volume is a collection of articles written by Nobel Laureate Rita Levi Montalcini and published from 1942 to 1995 Studies described in the first part set the stage for the discovery of a protein molecule which became known as the Nerve Growth Factor NGF described in detail in the second part The NGF synthesized in minute amounts in all vertebrate tissues plays an essential role in the differentiation and survival of several nerve cell populations in the peripheral and central nervous system The discovery of the NGF was defined by the Nobel Foundation as a milestone in developmental neurobiology and the author was awarded in 1986 with this prestigious award Studies pursued in subsequent years and still in progress have unveiled other fundamental properties of the NGF described in the third part of this volume

New Frontiers of Cancer Causation Iversen,1993-08-01 Proceedings of the Second International Conference on Theories of Carcinogenesis held in Oslo Norway August 1992 The papers which discuss principles and theories rather than experimental setups and results cover a wide range of topics including cell proliferation metastasis oncogenes carcinogens

genetic alterations viruses immunology and radiation Also detailed are public attitudes toward cancer as well as attitudes of professionals in cancer research The volume concludes with some brief considerations from speakers and participants
