Friedlaender,2003-02-01 How should air pollution be brought under control Should effluent fees or pollution taxes be imposed Should specific standards be legislated backed by enforceable sanctions against violators restricting or banning outright various sources of pollution Would an effective mix of these policies work better in the real world Or should radically new mechanisms be devised These are among the questions that are confronted directly in the form of specific and actual cases by the contributors to this volume which is addressed more to citizens at large than to specialists in circumscribed academic or administrative niches Put another way the book is more concerned with here and now realities and manageable solutions than with lobbying for particular disciplinary jurisdictions or for rigid doctrines As its editor writes Instead of analyzing the merits and weaknesses of effluent fees and standards in detail the authors in this volume address the issue of alternative approaches to controlling air pollution As such they are not concerned with questions of economic doctrine or issues of social justice but rather with entirely pragmatic questions of implementation and whether it is possible to devise some scheme that permits the simplicity of standards but contains a safety valve of fines or fees that obviates the need for recontracting if the standards turn out to be excessively stringent Thus by examining in some detail the record of air pollution control since the passage of the Clean Air Act of 1970 and by considering some concrete proposals for change the authors in this volume make a major contribution toward the adoption of more rational means of controlling air pollution

quality planning and includes a presentation of a decision maker's viewpoint illustrations of various types of models descriptive and or decision models available to decision makers assessments of the role of models in actual decision making and two papers on the more traditional question of the significance and range of application of descriptive models i.e. of models that represent the physics of the air pollution phenomenon Part Two is devoted primarily to real time control It includes a presentation of the IIASA case study of the Venetian lagoon and papers on various aspects of this research on alternative concentration predictors and descriptions of implementations of real time forecast and control schemes in Japan and Italy

The Regulatory Approach to Air Quality Management Winston Harrington,2016-03-17 In the wake of the Clean Air Amendments of 1970 in the United States sources of emissions could be held accountable for the degradation of air quality in the local environment This case study of air quality management in New Mexico was produced to shed some light on the procedures and activities used by agencies in order to control air quality Originally published in 1981 Winston Harrington uses New Mexico as a case study for its largely centralised control system in Santa Fe to explore the behaviour of air quality agencies and pollution sources and comments on policy implications from this study's conclusions This title will be of interest to students of environmental studies and policy makers
