*Beasts of the Earth* E. Fuller Torrey, Robert H. Yolken, 2005-02-03 Humans have lived in close proximity to other animals for thousands of years Recent scientific studies have even shown that the presence of animals has a positive effect on our physical and mental health People with pets typically have lower blood pressure show fewer symptoms of depression and tend to get more exercise But there is a darker side to the relationship between animals and humans Animals are carriers of harmful infectious agents and the source of a myriad of human diseases In recent years the emergence of high profile illnesses such as AIDS SARS West Nile virus and bird flu has drawn much public attention but as E Fuller Torrey and Robert H Yolken reveal the transfer of deadly microbes from animals to humans is neither a new nor an easily avoided problem Beginning with the domestication of farm animals nearly 10 000 years ago *Beasts of the Earth* traces the ways that human animal contact has evolved over time Today shared living quarters overlapping ecosystems and experimental surgical practices where organs or tissues are transplanted from non humans into humans continue to open new avenues for the transmission of infectious agents Other changes in human behavior like increased air travel automated food processing and threats of bioterrorism are increasing the contagion factor by transporting microbes further distances and to larger populations in virtually no time at all While the authors urge that a better understanding of past diseases may help us lessen the severity of some illnesses they also warn that given our increasingly crowded planet it is not a question of if but when and how often animal transmitted diseases will pose serious challenges to human health in the future

suffering and the compromises that result He traces the history of the most widely used animal and in vitro models describing how they compete with one another in a changing ecosystem of models He examines how therapies for bacterial and viral infections cancer cardiovascular diseases and neurological disorders have been developed using animal and cell culture models and how research into these diseases has both taken advantage of and been hindered by model system differences Finally Striedter argues for a big tent biology in which a diverse set of models and research strategies can coexist productively     *Agency for International Development Contract Operations (Office of Research, Evaluation, and Planning Assistance Staff)* United States.
