1 Introduction

To make informed choices among middleware alternatives, developers of distributed object systems should understand the patterns and components used to implement key features in CORBA, ORBs, Remote Object Interconnection Systems [1, 2, 3] have explored the features of the CORBA Messaging specification [4]. In this article, we describe key C++ features, patterns, and components used to implement an OMG IDL compiler that supports the Asynchronous Method Invocation (AMI) callback model defined in the CORBA Messaging specification.

The CORBA Messaging specification defines two AMI programming models, the polling model and the callback model. In both models, only clients behave asynchronously, i.e., server applications do not change at all. These AMI models are outlined briefly below:

Polling model: In this model, each two-way AMI operation returns a Poller value type [5], which is very much like a C++ or Java object in that it has both data members and methods. Operations on a Poller are just local C++ method calls and not remote CORBA operation invocations. The polling model is illustrated in Figure 1. The client can use the Poller methods to check the status of the request so it can obtain a server's reply. If the server hasn't replied yet, the client can either (1) block awaiting its arrival or (2) return to the calling thread immediately and check back on the Poller to obtain the result type when it's convenient.

Figure 1: Polling Model for CORBA Asynchronous Two-way Operations

Callback model: In this model, when a client invokes a two-way asynchronous operation on an object, it passes an object reference to a reply handler server as a parameter, as shown in Figure 2. This object reference is not passed to the server, but instead is used locally by the client ORB. When

Figure 2: Callback Model for CORBA Asynchronous Two-way Operations

the server replies, the client ORB receives the response and uses the reply handler server provided by the client application to dispatch the response to the appropriate callback operation. This model requires client application developers to obtain and initialize a PCAN used to activate objects in the PCAN, which effectively makes the application behave as both a client and a server.
