Alternatives to the Current Use of Nitrite in Foods Assembly of Life Sciences (U.S.). Committee on Nitrite and Alternative Curing Agents in Food, 1982 Abstract This first volume of a 2 volume report attempts to assess the health risks associated with overall exposure to nitrate nitrite and N nitroso compounds with emphasis on the risks from natural and supplemented nitrate and nitrite in foods and the use of nitrite as a food preservative An evaluation was made of the toxicologic and carcinogenic significance of exposure to these chemical species and their potential health risks A number of conclusions are developed from this evaluative report These include nitrate is neither carcinogenic nor mutagenic nitrite is not a direct acting carcinogen most N nitroso compounds are carcinogenic in laboratory animals but the experimental data are of limited value in predicting their quantitative risk to humans the nitrosation inhibiting effects of ascorbate and other substances have been established and due to possible health risk in using nitrate as a curing agent a search for alternatives should be continued The use of nitrate and nitrite in foods and the chemistry of these materials are discussed wz Nitrates and Nitrites in Food and Water Michael J Hill, 1996-07-01 From the Introduction With regard to nitrate and nitrite the perceived hazards are to the ecological balance in rivers and lakes and to human health Increased nitrate levels in river water lead to increased growth of algae and consequent decrease in the level of biologically available oxygen BAO In extreme forms the algae form unsightly blooms on the water surface and the BAO level falls below that necessary to support fish and other animal life At this extreme there is little dispute that efforts should be made to restore the ecological balance and this is best achieved by reversing the increase in nitrate concentration that caused the problem The health hazards are less clear but include the risk of methaemoglobinaemia in young infants and the possible risk of gastric cancer particularly in certain high risk patient groups These health risks have led to legislation to control the exposure of humans to nitrate from drinking water and as a food additive What can be done about this and how can the problem be solved if indeed there is a problem It is normal practice to add nitrate and nitrite to food as a cosmetic and as a preservative Is this necessary If so how much do we need to add Are there alternatives What effect does added nitrate have on total nitrate exposure of humans In this book we have attempted to answer or at least to give the background to some of the questions **National Library of Medicine**

these challenges may concurrently present the food industry with unique and exciting opportunities The processed meat industry despite its long history and tradition is certainly not exempt from having to face these modern challenges nor excluded from realizing the promises of the opportunities that may lie ahead *Our Precarious Habitat* Melvin A.
