Ryan,2011-06-29 Arc continent collision has been one of the important tectonic processes in the formation of mountain belts throughout geological time and it continues to be so today along tectonically active plate boundaries such as those in the SW Pacific or the Caribbean Arc continent collision is thought to have been one of the most important process involved in the growth of the continental crust over geological time and may also play an important role in its recycling back into the mantle via subduction Understanding the geological processes that take place during arc continent collision is therefore of importance for our understanding of how collisional orogens evolve and how the continental crust grows or is destroyed Furthermore zones of arc continent collision are producers of much of the worlds primary economic wealth in the form of minerals so understanding the processes that take place during these tectonic events is of importance in modeling how this mineral wealth is formed and preserved This book brings together seventeen papers that are dedicated to the investigation of the tectonic processes that take place during arc continent collision It is divided into four sections that deal firstly with the main players involved in any arc continent collision the continental margin the subduction zone and finally the volcanic arc and its mineral deposits The second section presents eight examples of arc continent collisions that range from being currently active through to Palaeoproterozoic in age The third section contains two papers one that deals with the obduction of large slab ophiolites and a second that presents a wide range of physical models of arc continent collision The fourth section brings everything that comes before together into a discussion of the processes of arc continent collision

Stanley,2008 Displaced or tectonostratigraphic terranes comprise a huge portion of real estate in the North American Cordillera Terranes are discrete fault bound blocks of regional extent with rocks and fossils that differ to a great extent from those of adjacent blocks The allochthonous nature of most terranes relative to adjacent craton is well established When mapped they resemble a collage of mixed rock types tectonic styles metamorphism and volcanic origins each part resembling the pieces of a puzzle Terrane studies remain integral to understanding the geological evolution of western North America Since the initiation of the concept summarized in 1979 by the late David L Jones the significance of fossils and stratigraphy has been key to solving the puzzle Chapters of this book written by experts in their field provide a sense of the diversity of approaches in paleontology and stratigraphy Contributions span geologic time from the Precambrian Vendian to Cretaceous and address over 20 Cordilleran terranes Publisher s website **Gulf of Alaska/Cook Inlet Sale**
