Almost Automorphic And Almost Periodic Dynamics In Skew Product Semiflows:

Almost Automorphic and Almost Periodic Dynamics in Skew-Product Semiflows Wenxian Shen, Yingfei Yi, 1998
This volume is devoted to the study of almost automorphic dynamics in differential equations. By making use of techniques from abstract topological dynamics it is shown that almost automorphy, a notion which was introduced by S. Bochner in 1955, is essential and fundamental in the qualitative study of almost periodic differential equations.

Infinite Dimensional Dynamical Systems John Mallet-Paret, Jianhong Wu, Huaiping Zhu, Yingfei Yi, 2012-10-11
This collection covers a wide range of topics of infinite dimensional dynamical systems generated by parabolic partial differential equations, hyperbolic partial differential equations, solitary equations, lattice differential equations, delay differential equations, and stochastic differential equations. Infinite dimensional dynamical systems are generated by evolutionary equations describing the evolutions in time of systems whose status must be depicted in infinite dimensional phase spaces. Studying the long term behaviors of such systems is important in our understanding of their spatiotemporal pattern formation and global continuation and has been among major sources of motivation and applications of new developments of nonlinear analysis and other mathematical theories. Theories of the infinite dimensional dynamical systems have also found more and more important applications in physical, chemical, and life sciences. This book collects 19 papers from 48 invited lecturers to the International Conference on Infinite Dimensional Dynamical Systems held at York University, Toronto, in September of 2008. As the conference was dedicated to Professor George Sell from the University of Minnesota on the occasion of his 70th birthday, this collection reflects the pioneering work and influence of Professor Sell in a few core areas of dynamical systems, including non-autonomous dynamical systems, skew product flows, invariant manifolds, theory of infinite dimensional dynamical systems, approximation, dynamics, and fluid flows.

Stability and Bifurcation Theory for Non-Autonomous Differential Equations Anna Capietto, Peter Kloeden, Jean Mawhin, Sylvia Novo, Miguel Ortega, 2012-12-14
This volume contains the notes from five lecture courses devoted to nonautonomous differential systems in which appropriate topological and dynamical techniques were described and applied to a variety of problems. The courses took place during the C I M E Session Stability and Bifurcation Problems for Non Autonomous Differential Equations held in Cetraro, Italy, June 19-25, 2011. Anna Capietto and Jean Mawhin lectured on nonlinear boundary value problems; they applied the Maslov index and degree theoretic methods in this context. Rafael Ortega discussed the theory of twist maps with nonperiodic phase and presented applications. Peter Kloeden and Sylvia Novo showed how dynamical methods can be used to study the stability, bifurcation properties of bounded solutions and of attracting sets for nonautonomous differential and functional differential equations. The volume will be of interest to all researchers working in these and related fields.

Almost Periodic Type Functions and Ergodicity Zhang Chuanyi, 2003-06-30 The theory of almost periodic functions was first developed by the Danish mathematician H Bohr during 1925 1926 Then Bohr's work was substantially extended by S Bochner H Weyl A Besicovitch J Favard J von Neumann V V Stepanov N N Bogolyubov and others Generalization of the classical theory of almost periodic functions has been taken in several directions One direction is the broader study of functions of almost periodic type Related this is the study of ergodicity It shows that the ergodicity plays an important part in the theories of function spectrum semigroup of bounded linear operators and dynamical systems The purpose of this book is to develop a theory of almost periodic type functions and ergodicity with applications in particular to our interest in the theory of differential equations functional differential equations and abstract evolution equations The author selects these topics because there have been many excellent books on almost periodic functions and relatively few books on almost periodic type and ergodicity The author also wishes to reflect new results in the book during recent years The book consists of four chapters In the first chapter we present a basic theory of four almost periodic type functions Section 1 1 is about almost periodic functions To make the reader easily learn the almost periodicity we first discuss it in scalar case After studying a classical theory for this case we generalize it to finite dimensional vector valued case and finally to Banach valued including Hilbert valued situation Dynamical Systems,

Dynamical Systems in Population Biology Xiao-Qiang Zhao, 2013-06-05 Population dynamics is an important subject in mathematical biology A central problem is to study the long term behavior of modeling systems Most of these systems are governed by various evolutionary equations such as difference ordinary functional and partial differential equations see e g 165 142 218 119 55 As we know interactive populations often live in a fluctuating environment For example physical environmental conditions such as temperature and humidity and the availability of food water and other resources usually vary in time with seasonal or daily variations Therefore more realistic models should be nonautonomous systems In particular if the data in a model are periodic functions of time with commensurate period a periodic system arises if these periodic functions have different minimal periods we get an almost periodic system The existing reference books from the dynamical systems point of view mainly focus on autonomous biological systems The book of Hess 106J is an excellent reference for periodic parabolic boundary value problems with applications to population dynamics Since the publication of this book there

have been extensive investigations on periodic asymptotically periodic almost periodic and even general nonautonomous biological systems which in turn have motivated further development of the theory of dynamical systems In order to explain the dynamical systems approach to periodic population problems let us consider as an illustration two species periodic competitive systems

Almost Periodicity and Almost Automorphy Abdallah Afoukal, Brahim Es-sebbar, Khalil Ezzinbi, Gaston Mandata N'Guérékata, 2025-03-03 When we study differential equations in Banach spaces whose coefficients are linear unbounded operators we feel that we are working in ordinary differential equations however the fact that the operator coefficients are unbounded makes things quite different from what is known in the classical case Examples or applications for such equations are naturally found in the theory of partial differential equations More specifically if we give importance to the time variable at the expense of the spatial variables we obtain an ordinary differential equation with respect to the variable which was put in evidence Thus for example the heat or the wave equation gives rise to ordinary differential equations of this kind Adding boundary conditions can often be translated in terms of considering solutions in some convenient functional Banach space The theory of semigroups of operators provides an elegant approach to study this kind of systems Therefore we can frequently guess or even prove theorems on differential equations in Banach spaces looking at a corresponding pattern in finite dimensional ordinary differential equations

Theory of Translation Closedness for Time Scales Chao Wang, Ravi P. Agarwal, Donal O' Regan, Rathinasamy Sakthivel, 2020-05-05 This monograph establishes a theory of classification and translation closedness of time scales a topic that was first studied by S Hilger in 1988 to unify continuous and discrete analysis The authors develop a theory of translation function on time scales that contains piecewise almost periodic functions piecewise almost automorphic functions and their related generalization functions e g pseudo almost periodic functions weighted pseudo almost automorphic functions and more Against the background of dynamic equations these function theories on time scales are applied to study the dynamical behavior of solutions for various types of dynamic equations on hybrid domains including evolution equations discontinuous equations and impulsive integro differential equations The theory presented allows many useful applications such as in the Nicholson's blowflies model the Lasota Wazewska model the Keynesian Cross model in those realistic dynamical models with a more complex hybrid domain considered under different types of translation closedness of time scales and in dynamic equations on mathematical models which cover neural networks This book provides readers with the theoretical background necessary for accurate mathematical modeling in physics chemical technology population dynamics biotechnology and economics neural networks and social sciences

Kostić, 2023-06-06 The theory of almost periodic functions is a very active field of research for scholars This research monograph analyzes various classes of multi dimensional metrically almost periodic type functions with values in complex Banach spaces We provide many applications of our theoretical results to the abstract Volterra integro differential inclusions in Banach spaces **Dynamics of Evolutionary Equations** George R. Sell, Yuncheng You, 2013-04-17 The theory and applications of infinite dimensional dynamical systems have attracted the attention of scientists for quite some time Dynamical issues arise in equations that attempt to model phenomena that change with time The infinite dimensional aspects occur when forces that describe the motion depend on spatial variables or on the history of the motion In the case of spatially dependent problems the model equations are generally partial differential equations and problems that depend on the past give rise to differential delay equations Because the nonlinearities occurring in these equations need not be small one needs good dynamical theories to understand the longtime behavior of solutions Our basic objective in writing this book is to prepare an entree for scholars who are beginning their journey into the world of dynamical systems especially in infinite dimensional spaces In order to accomplish this we start with the key concepts of a semiflow and a flow As is well known the basic elements of dynamical systems such as the theory of attractors and other invariant sets have their origins here

Nonautonomous Dynamical Systems in the Life Sciences Peter E. Kloeden, Christian Pötzsche, 2014-01-22 Nonautonomous dynamics describes the qualitative behavior of evolutionary differential and difference equations whose right hand side is explicitly time dependent Over recent years the theory of such systems has developed into a highly active field related to yet recognizably distinct from that of classical autonomous dynamical systems This development was motivated by problems of applied mathematics in particular in the life sciences where genuinely nonautonomous systems abound The purpose of this monograph is to indicate through selected representative examples how often nonautonomous systems occur in the life sciences and to outline the new concepts and tools from the theory of nonautonomous dynamical

Simplicial Dynamical Systems Ethan Akin, 1999 A simplicial dynamical system is a simplicial map $g: K \rightarrow K$ where K is a finite simplicial complex triangulating a compact polyhedron X and K is a proper subdivision of X for example the barycentric or any further subdivision the dynamics of the associated piecewise linear map $g: X \rightarrow X$ can be analyzed by using certain naturally related subshifts of finite type Any continuous map on X can be approximated by such systems Other examples yield interesting

The Riemann Problem for the Transportation Equations in Gas Dynamics Wancheng Sheng, Tong Zhang, 1999 In this volume the one dimensional and two dimensional Riemann problems for the transportation equations in gas dynamics are solved constructively In either the 1 D or 2 D case there are only two kinds of solutions one involves Dirac delta waves and the other involves vacuums which has been merely discussed so far The generalized Rankine Hugoniot and entropy conditions for Dirac delta waves are clarified with viscous vanishing method All of the existence uniqueness and stability for viscous perturbations are proved analytically

Tensor Products and Independent Sums of L_p -Spaces Dale Edward Alspach, 1999 Two methods of constructing infinitely many isomorphically distinct L_p spaces have been published In this volume the author shows that these constructions yield very different spaces and in the process develop methods for dealing with these spaces from the isomorphic viewpoint
