Biodiversity In Managed Landscapes Theory And Practice:

Biodiversity in Managed Landscapes Robert C. Szaro, David W. Johnston, 1996 The conservation of biodiversity has profound implications for managing natural resources with the need for scientific information as a foundation for management decisions increasing dramatically The intent of this book is to look beyond the theory of biodiversity to the principles practices and policies needed for its conservation Its objectives are to provide the scientific basis for understanding biodiversity document case examples of theory and concepts applied at differing scales and examine policies that affect its conservation Integrating Landscape Ecology Into Natural Resource Management Jianguo Liu, William W. Taylor, 2002-08 The rapidly increasing global population has dramatically increased the demands for natural resources and has caused significant changes in quantity and quality of natural resources To achieve sustainable resource management it is essential to obtain insightful guidance from emerging disciplines such as landscape ecology This text addresses the links between landscape ecology and natural resource management These links are discussed in the context of various landscape types a diverse set of resources and a wide range of management issues A large number of landscape ecology concepts principles and methods are introduced Critical reviews of past management practices and a number of case studies are presented This text provides many guidelines for managing natural resources from a landscape perspective and offers useful suggestions for landscape ecologists to carry out research relevant to natural resource management In addition it will be an ideal supplemental text for graduate and advanced undergraduate ecology courses *Policy and Practices for Biodiversity in Managed Forests* Fred Bunnell, 2011-11-01 Is it possible to sustain biological diversity in managed forests Or should biodiversity strategies focus solely on reserves and protected areas A group of well known scientists specializing in forestry issues apply scientific expertise to the hot politics of the forestry debate and present compelling evidence as to the sustainability of biological diversity in managed forests Seventeen major questions facing policy makers managers and researchers are posed in this book These questions are grouped under three major headings Where are we going How do we get there How will we know when we are there The first three chapters set the stage and provide context Fred Bunnell reviews the changing values desired from forests and changing rhythms within a forest the living dance He and Ann Chan McLeod then describe issues of managed forests that complicate efforts to sustain biological diversity Jagmohan S Maini provides an overview of policy issues confronting governments The next five chapters treat these questions and management actions at different levels of biological organization They begin with genetics Gene Namkoong and populations Gray Merriam proceed through communities Daniel Simberloff and landscapes J Stan Rowe closing with a more general treatment of scale Reed F Noss The final chapter integrates the treatments of different scales of organization by returning to the original 17 questions and providing answers based on current knowledge *Policy and Practices for Biodiversity in Managed Forests* addresses the major problems facing policy makers and managers in sustaining biological diversity in managed forests It is

important because it links the scientific knowledge about biodiversity to the management of biodiversity bridging the gap between scientists and decision makers The unique focused approach of this book makes it useful for students resource practitioners and policy makers

Models for Planning Wildlife Conservation in Large Landscapes Joshua Millspaugh, Frank R. Thompson, 2011-04-28

A single resource volume of information on the most current and effective techniques of wildlife modeling Models for Planning Wildlife Conservation in Large Landscapes is appropriate for students and researchers alike The unique blend of conceptual methodological and application chapters discusses research applications and concepts of modeling and presents new ideas and strategies for wildlife habitat models used in conservation planning The book makes important contributions to wildlife conservation of animals in several ways 1 it highlights historical and contemporary advancements in the development of wildlife habitat models and their implementation in conservation planning 2 it provides practical advice for the ecologist conducting such studies and 3 it supplies directions for future research including new strategies for successful studies

Intended to provide a recipe for successful development of wildlife habitat models and their implementation in conservation planning the book could be used in studying wildlife habitat models conservation planning and management techniques Additionally it may be a supplemental text in courses dealing with quantitative assessment of wildlife populations Additionally the length of the book would be ideal for graduate student seminar course

Using wildlife habitat models in conservation planning is of considerable interest to wildlife biologists With ever tightening budgets for wildlife research and planning activities there is a growing need to use computer methods Use of simulation models represents the single best alternative However it is imperative that these techniques be described in a single source Moreover biologists should be made aware of alternative modeling techniques It is also important that practical guidance be provided to biologists along with a demonstration of utility of these procedures Currently there is little guidance in the wildlife or natural resource planning literature on how best to incorporate wildlife planning activities particularly community based approaches Now is the perfect time for a syntheistic publication that clearly outlines the concepts and available methods and illustrates them Only single resource book of information not only on various wildlife modeling techniques but also with practical guidance on the demonstrated utility of each based on real world conditions Provides concepts methods

and applications for wildlife ecologists and others within a GIS context Written by a team of subject area experts *Status and Management of Neotropical Migratory Birds* Deborah M. Finch, Peter W. Stangel, 1993 *Conservation Biology* Peggy L. Fiedler, Peter M. Kareiva, 2012-12-06 Reflecting what a new generation of conservation biologists is doing and thinking this vital and far ranging second edition explores where conservation biology is heading It challenges many conventions of conservation biology by exposing certain weaknesses of widely accepted principles Combining contributions from both the school and the new breed of conservation biologists this insightful text focuses primarily on topics that are integral to the daily activities of conservation biologists Several chapters address ecosystem restoration and biotic invasions as well as the mechanics of population viability analyses which are now a routine facet of conservation efforts A case history approach is implemented throughout the book with the use of practical real world examples Furthermore an in depth look at quantitative analyses is presented allowing for models and mathematical analyses to pinpoint limitations in existing data and guide research toward those aspects of biology that are most likely to be critical to the dynamics of a species or an ecosystem

Criteria and Indicators for Sustainable Forest Management Robert John Raison, Alan Gordon Brown, David W. Flinn, 2001 There is increasing pressure on the forestry industry to adopt sustainable practices but a lack of knowledge about how to facilitate this and how to measure sustainability This book reviews current thinking about scientifically based indicators and sustainable management of natural forests and plantations Information is applicable to boreal temperate and tropical biomes The contents have been developed from papers presented at a IUFRO conference held in Australia in order to develop a state of the art report on this subject **Coastal Dunes** M. L. Martínez, Norbert P. Psuty, 2007-09-14 Coastal dunes occur in almost every latitude from tropical to polar and have been substantially altered by human activities Many are already severely and irreversibly degraded Although these ecosystems have been studied for a long time as early as 1835 there has been a strong emphasis on the mid latitude dune systems and a lack of attention given to the tropics where unfortunately much of the modern exploitation and coastal development for tourism is occurring This book brings together coastal dune specialists from tropical and temperate latitudes which together cover a wide set of topics including geomorphology community dynamics ecophysiology biotic interactions and environmental problems and conservation A major product of this book is a set of recommendations for future research identifying relevant topics where detailed knowledge is still lacking It also identifies management tools that will promote and maintain the rich diversity of the dune environments in the context of continuing coastal development *Park Science* , 1994 **The Environment in Anthropology** Nora Haenn, Richard Wilk, 2006 Presenting ecology and current environmental studies from an anthropological point of view this book gives readers a strong intellectual foundation as well as offering practical tools for solving environmental problems *Energy Research Abstracts* , 1992-10 *The International Yearbook of Environmental and Resource Economics* 2005/2006 Henk Folmer, Thomas H. Tietenberg, 2005-01-01 The International Yearbook of

Environmental and Resource Economics presents articles which are surveys of current issues in this research area where literature is abundant. As every year we recommend the present yearbook to keep up with the developments of this literature.

Michel Griffon Quarterly Journal of International Agriculture The Yearbook provides a comprehensive overview of cutting edge issues in environmental and resource economics. The expert contributors address some of today's most pressing environmental topics including issues in water pricing reforms, spatial environmental policy, environmental equity and the siting of hazardous waste facilities, strategies to conserve biodiversity, corporate sustainability, the double dividend hypothesis of environmental taxes, valuing environmental changes in the presence of risk. The Yearbook will provide economists, scholars and practitioners working in environmental and resource economics with a comprehensive overview of the cutting edge issues in the field.

AIMing for Healthy Forests Andrew B. Carey, 2007 Environmental Quality Council on Environmental Quality (U.S.), 1993 Service-wide Benefits-sharing, 2009 **Wild Species as Commodities** Curtis Freese, 2012-06-22

In recent years some policymakers and conservationists have argued that natural resources will be protected only if economic benefits accrue to those who are responsible for caring for the resources. Such commercial consumptive use of wild species (CCU) provides an economically viable alternative to more ecologically destructive land uses and could help accomplish the overall goals of biodiversity conservation. Yet many questions remain: Will the harvest of wild species be sustainable? Will habitats be protected? What tradeoffs are implied for the populations and ecosystems under management? While this debate goes on, researchers and managers are confronting an array of real world problems in managing harvested populations of wild species. *Wild Species as Commodities* presents a balanced, scientifically rigorous consideration of the link between CCU and biodiversity conservation. The outgrowth of a four year World Wildlife Fund study, the book is both a synthesis of findings and a practical guide. Topics examined include forestry, fisheries, sport hunting and nontimber forest products, the economics of wild species use, social and institutional frameworks required for sustainability, ecological impacts, biodiversity consequences of ecosystem specialization, conservation benefits of wild species use, management principles and guidelines. *Wild Species as Commodities* provides a primer on the CCU biodiversity link and an interdisciplinary analysis of the major economic, social and ecological factors involved, along with guidelines for incorporating biodiversity conservation into commercial harvesting programs. It is a highly accessible source of information, concepts and management approaches for professionals in resource management and wildlife conservation and academics in conservation biology, environmental and ecological economics and environmental studies.
