Bioinformatics of Genome Regulation and Structure II Nikolay Kolchanov, Ralf Hofstaedt, Luciano Milanese, 2006-06-15 The last 15 years in development of biology were marked with accumulation of unprecedentedly huge arrays of experimental data The information was amassed with exclusively high rates due to the advent of highly efficient experimental technologies that provided for high throughput genomic sequencing of functional genomics technologies allowing investigation of expression dynamics of large groups of genes using expression DNA chips of proteomics methods giving the possibility to analyze protein compositions of cells tissues and organs assess the dynamics of the cell proteome and reconstruct the networks of protein protein interactions and of metabolomics in particular high resolution mass spectrometry study of cell metabolites and distribution of metabolic fluxes in the cells with a concurrent investigation of the dynamics of thousands metabolites in an individual cell Analysis comprehension and use of the tremendous volumes of experimental data reflecting the intricate processes underlying the functioning of molecular genetic systems are unfeasible in principle without the systems approach and involvement of the state of the art information and computer technologies and efficient mathematical methods for data analysis and simulation of biological systems and processes The need in solving these problems initiated the birth of a new science postgenomic bioinformatics or systems biology in silico
