 relatively new field of research It evolved from the requirement to process characterize and apply the information being
 produced by DNA sequencing technology The production of DNA sequence data continues to grow exponentially At the same
 time improved bioinformatics such as faster DNA sequence search methods have been combined with increasingly powerful
 computer systems to process this information Methods are being developed for the ever more detailed quantification of gene
 expression providing an insight into the function of the newly discovered genes while molecular genetic tools provide a link
 between these genes and heritable traits Genetic tests are now available to determine the likelihood of suffering specific
 ailments and can predict how plant cultivars may respond to the environment The steps in the translation of the genetic
 blueprint to the observed phenotype is being increasingly understood through proteome metabolome and phenome analysis
 all underpinned by advances in bioinformatics Bioinformatics is becoming increasingly central to the study of biology and a
 day at a computer can often save a year or more in the laboratory The volume is intended for graduate level biology students
