Antituberculosis Drugs Karl Bartmann,2013-03-07 This volume deals specifically with those antituberculosis drugs which passed the preclinical phase and have been or are used in the treatment of tuberculosis and other mycobacterial diseases except leprosy in at least some parts of the world Despite this restriction there are 14 such drugs and as a result this volume has reached rather large proportions To prevent it from becoming even larger and more unwidely most derivatives of antituberculosics have been omitted especially where it is claimed that they provide only better bioavailability or tolerability Only in the chapter on the chemotherapy of diseases due to so called atypical mycobacteria is the clinical use of the drugs described to a certain extent In addition to antituberculosics also discussed are antimicrobials which have been found to be effective against these mycobacteria The sequence in which the drugs are described is historical reflecting not the time of discovery but rather the first clinical application This order was selected for reasons which are now no longer relevant In this volume less emphasis is placed on detection biological or synthetic production of antituberculosics and structure activity relationships In contrast emphasis is put on the degree type and mechanism of antimycobacterial activity pharmacokinetics and biotransformation in animals and man on experimental pharmacodynamics and on the toxicity of antituberculosics used therapeutically
