Conserving Forest Biodiversity David B. Lindenmayer,Jerry F. Franklin,2013-04-10 While most efforts at biodiversity conservation have focused primarily on protected areas and reserves the unprotected lands surrounding those areas the matrix are equally important to preserving global biodiversity and maintaining forest health In *Conserving Forest Biodiversity* leading forest scientists David B Lindenmayer and Jerry F Franklin argue that the conservation of forest biodiversity requires a comprehensive and multiscaled approach that includes both reserve and nonreserve areas They lay the foundations for such a strategy bringing together the latest scientific information on landscape ecology forestry conservation biology and related disciplines as they examine the importance of the matrix in key areas of ecology such as

metapopulation dynamics habitat fragmentation and landscape connectivity general principles for matrix management using natural disturbance regimes to guide human disturbance landscape level and stand level elements of matrix management the role of adaptive management and monitoring social dimensions and tensions in implementing matrix based forest management In addition they present five case studies that illustrate aspects and elements of applied matrix management in forests The case studies cover a wide variety of conservation planning and management issues from North America South America and Australia ranging from relatively intact forest ecosystems to an intensively managed plantation Conserving Forest Biodiversity presents strategies for enhancing matrix management that can play a vital role in the development of more effective approaches to maintaining forest biodiversity It examines the key issues and gives practical guidelines for sustained forest management highlighting the critical role of the matrix for scientists managers decisionmakers and other stakeholders involved in efforts to sustain biodiversity and ecosystem processes in forest landscapes Microevolution Rate, Pattern, Process Andrew P. Hendry, Michael T. Kinnison, 2012-12-06 From guppies to Galapagos finches and from adaptive landscapes to haldanes this compilation of contributed works provides reviews perspectives theoretical models statistical developments and empirical demonstrations exploring the tempo and mode of microevolution on contemporary to geological time scales New developments and reviews of classic and novel empirical systems demonstrate the strength and diversity of evolutionary processes producing biodiversity within species Perspectives and theoretical insights expand these empirical observations to explore patterns and mechanisms of microevolution methods for its quantification and implications for the evolution of biodiversity on other scales This diverse assemblage of manuscripts is aimed at professionals graduate students and advanced undergraduates who desire a timely synthesis of current knowledge an illustration of exciting new directions and a springboard for future investigations in the study of microevolution in the wild *Artificial Intelligence and Biological Sciences* P.V. Evaluating the Taxonomic Status of the Mexican Gray Wolf and the Red Wolf National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Board on Agriculture and Natural Resources, Board on Life Sciences, Committee on Assessing the Taxonomic Status of the Red Wolf and the Mexican Gray Wolf, 2019-06-01

Scientists strive to develop clear rules for naming and grouping living organisms But taxonomy the scientific study of biological classification and evolution is often highly debated Members of a species the fundamental unit of taxonomy and evolution share a common evolutionary history and a common evolutionary path to the future Yet it can be difficult to determine whether the evolutionary history or future of a population is sufficiently distinct to designate it as a unique species A species is not a fixed entity the relationship among the members of the same species is only a snapshot of a moment in time Different populations of the same species can be in different stages in the process of species formation or dissolution In some cases hybridization and introgression can create enormous challenges in interpreting data on genetic distinctions between groups Hybridization is far more common in the evolutionary history of many species than previously recognized As a result the precise taxonomic status of an organism may be highly debated This is the current case with the Mexican gray wolf *Canis lupus baileyi* and the red wolf *Canis rufus* and this report assesses the taxonomic status for each

The Chemistry of Biology Armin Börner, Juliana Zeidler, 2023-02-14 Living organisms are distinguished by their chemical basis Thus knowledge of the properties of the elements and the interactions of the resulting compounds is a prerequisite for understanding biology Chemistry answers the questions of why among the more than 100 elements of the periodic table PSE carbon and not silicon is the dominant element in biology and why precious metals such as gold and silver do not play a role The PSE provides information about why phosphoric acid and not sulfuric acid acts as a bridge in polynucleic acids and why DNA had to evolve from RNA At the same time only chemistry makes clear why D glucose is so central in building biopolymers such as cellulose and glycogen and why the citrate cycle is logically self contained and without alternative Biochemistry is also a synthesis chemistry that differs from man made synthesis chemistry only in terms of the framework conditions Individuals are selected from the multitude of elements of the PSE and the almost infinite number of chemical compounds The selection is based on

the environmental conditions on Earth such as moderate temperatures preferably atmospheric pressure solvent water and as primary reaction partner oxygen The hypothesis is developed that the guiding principle of modern biology the theory of evolution has its roots in the underlying chemistry This turns Darwinism from its biological head to its chemical feet For example the effect of phenols as radical scavengers is a priori chemical before biological phenomena could evolve from it as differences in distinction in colored flowering plants The book develops a completely new chemistry centered view of animate nature and challenges a changed biologically oriented didactics of chemistry in schools and universities **Journal of Biological Education** ,1989 **The Colobines** Ikki Matsuda,Cyril C.
