Biology And Exploitation Of The Minke Whale:

Biology and Exploitation of the Minke Whale Joseph W. Horwood, 1989-12-21 This comprehensive review includes much recent research material and is the only book exclusively devoted to the minke whale species The scope of this book focuses on three main topics The first emphasis is on the population biology of the minke whale Then it documents the historical and current exploitation by man Finally it evaluates the current size status and management of the many worldwide stocks of minke whales It also includes a description of the birth and death processes that determine how and why the minke whale population varies from time to time This is an excellent source for specialists in the fields of cetacean biology population biology and management of natural resources Presented in an interesting manner this work is also appreciated by students and technically interested lay readers

Quantitative Methods for Conservation Biology Scott Ferson, Mark Burgman, 2006-05-09 Quantitative methods are needed in conservation biology more than ever as an increasing number of threatened species find their way onto international and national red lists Objective evaluation of population decline and extinction probability are required for sound decision making Yet as our colleague Selina Heppell points out population viability analysis and other forms of formal risk assessment are underused in policy formation because of data uncertainty and a lack of standardized methodologies and unambiguous criteria i e rules of thumb Models used in conservation biology range from those that are purely heuristic to some that are highly predictive Model selection should be dependent on the questions being asked and the data that are available We need to develop a toolbox of quantitative methods that can help scientists and managers with a wide range of systems and that are subject to varying levels of data uncertainty and environmental variability The methods outlined in the following chapters represent many of the tools needed to fill that toolbox When used in conjunction with adaptive management they should provide information for improved monitoring risk assessment and evaluation of management alternatives The first two chapters describe the application of methods for detecting trends and extinctions from sighting data Presence absence data are used in general linear and additive models in Chapters 3 and 4 to predict the extinction proneness of birds and to build habitat models for plants

Marine Mammals of the World: A Comprehensive Guide to Their Identification Thomas Allen Jefferson, Marc A. Webber, Robert L. Pitman, 2011-08-29 With coverage on all the marine mammals of the world authors Jefferson Webber and Pitman have created a user friendly guide to identify marine mammals alive in nature at sea or on the beach dead specimens in hand and also to identify marine mammals based on features of the skull This handy guide provides marine biologists and interested lay people with detailed descriptions of diagnostic features illustrations of external appearance beautiful photographs dichotomous keys and more Full color illustrations and vivid photographs of every living marine mammal species are incorporated as well as comprehensible maps showing a range of information For readers who desire further consultation authors have included a list of literature references at the end of each species account For an enhanced understanding of

habitation this guide also includes recognizable geographic forms described separately with colorful paintings and photographs All of these essential tools provided make *Marine Mammals of the World* the most detailed and authoritative guide available Contains superb photographs of every species of marine mammal for accurate identification Authors collective experience adds up to 80 years and have seen nearly all of the species and distinctive geographic forms described in the guide Provides the most detailed and anatomically accurate illustrations currently available Special emphasis is placed on the identification of species in problem groups such as the beaked whales long beaked oceanic dolphin and southern fur seals Includes a detailed list of sources for more information at the back of the book *Walker's Marine Mammals of the World* Ronald M. Ethology and Behavioral Ecology of Mysticetes Christopher W. Clark, Ellen C. Garland, 2022-07-02 In this book an international team of leading marine mammal scientists with a remarkably diverse set of backgrounds and areas of expertise lead you through a synthesis of current knowledge on baleen whales Baleen whales are the largest animals ever to have lived on this planet They also have the lowest and most intense voices on Earth most likely evolved to take advantage of ocean acoustic transmission conditions so as to be detectable across ocean basins Some baleen whales can live to be 150-200 years old They migrate many thousands of kilometers between feeding and breeding areas They produce songs and calls that serve as behavioral foundations for establishing maintaining and expanding their cultural identities To conclude that we know the behavioral limits of these large-brained long-lived animals would be naive As baleen whale scientists we are still beginning to comprehend the enormous complexities and natural histories of these remarkable animals Today the fact that whales sing is known throughout much of the world This awareness started 50 years ago with the publication and popularization of a collection of humpback song recordings that motivated research into baleen whale behavioral ethology In this book's chapters a reader's experiences will stretch from learning about baleen whale laryngeal anatomy associated with their different voices to learning about the vast ocean areas over which their voices can be heard and the emerging complexities of their culturally defined societies These are accompanied by chapters on the fundamental ethological contexts of socializing migrating and foraging Two common themes permeate the book One theme highlights the phenomenal increase in scientific knowledge achieved through technological advancements The other theme recognizes the impacts of human-made activities on ocean acoustic environments and the resultant influences on the health and survival of individual whales and their populations Although the book is intentionally ambitious in its scope as scientists we fully recognize that baleen whale science is still in its infancy Many profound revelations await discovery by cohorts of young multi-talented explorers some of whom are stretching their wings in this volume and some of whom are reading these scientific stories for the first time

Cetacean Societies Janet Mann, 2000-06 Part review part testament to extraordinary dedication and part call to get involved Cetacean Societies highlights the achievements of behavioral ecologists inspired by the challenges of cetaceans and committed to the exploration of a new world from the preface by Richard Wrangham Long lived slow to reproduce and often hidden beneath the water's surface whales and dolphins cetaceans have remained elusive subjects for scientific study even though they have fascinated humans for centuries Until recently much of what we knew about cetaceans came from commercial sources such as whalers and trainers for dolphin acts Innovative research methods and persistent efforts however have begun to penetrate the depths to reveal tantalizing glimpses of the lives of these mammals in their natural habitats Cetacean Societies presents

the first comprehensive synthesis and review of these new studies Groups of chapters focus on the history of cetacean behavioral research and methodology state of the art reviews of information on four of the most studied species bottlenose dolphins killer whales sperm whales and humpback whales and summaries of major topics including group living male and female reproductive strategies communication and conservation drawn from comparative research on a wide range of species Written by some of the world s leading cetacean scientists this landmark volume will benefit not just students of cetology but also researchers in other areas of behavioral and conservation ecology as well as anyone with a serious interest in the world of whales and dolphins Contributors are Robin Baird Phillip Clapham Jenny Christal Richard Connor Janet Mann Andrew Read Randall Reeves Amy Samuels Peter Tyack Linda Weilgart Hal Whitehead Randall S Wells and Richard Wrangham *Marine Mammals* ,1995 Arctic Animals and Their Adaptations to Life on the Edge Arnoldus Schytte Blix,2005 Where and what is the Arctic What animals live there and how are they distributed How do they cope with cold in their austere environment and how can Arctic mammals survive birth when it is 40 degrees below freezing How can seals dive to a depth of 1000 metres and stay submerged for more than an hour and how does complete darkness in winter affect the inhabitants of the high Arctic This book answers these questions and also gives an introduction to the Arctic It is based on the author s 40 years of experience in the Arctic its environment and animal life As this book contains almost 200 illustrations and deals with the entire Arctic animal kingdom it will be suitable as a textbook for courses in Arctic biology and also serve specialists in the field It is a reference book and a source of information about published original literature

"New" POPs in Marine Mammals in Nordic Arctic and NE Atlantic Areas During Three Decades Maria Dam,2011 Marine mammals hold a special position in the hearts of people inhabiting Nordic Arctic areas and in coastal communities around the North Atlantic Ocean as they are an essential part of the diet and traditional life style However marine mammals are in a particularly vulnerable position as regards environmental pollutants because of the large fat stores in their bodies which serve as a magnet to a large number of persistent and toxic pollutants A Nordic Council of Ministers supported collaboration between Norway Denmark Greenland Faroe Island Iceland and Sweden set out to look for possible trends in new contaminants in marine mammals in Nordic Arctic waters The new contaminants in focus are the brominated flame retardants including the PBDEs methoxylated PBDEs perfluorinated compounds including the PFOS family and polychlorinated naphthalenes In addition a subset of the samples was analysed for brominated dioxins and dibenzofurans The marine mammals studied were fin whale minke whale pilot whale white sided dolphins harbour porpoise ringed seal and hooded seal The study aims at giving a wide scope of the presence of these new contaminants in marine mammals in recent time and going back to the 1980s using samples from specimen banks *Mariana Islands Range Complex* ,2010
