Biology Of Human Aging:

Biology of Human Aging Alexander P. Spence, 1989 **The Biology of Human Aging** John K. Hampton, 1991 *The Biology of Human Aging* John K. Hampton, Jr., 1989-01 **The Biology of Human Ageing** A. H. Bittles, K. J. Collins, 2009-06-04 The processes that control senescence have been the subject of more than a century of serious biological research Two institutions closely involved in this programme the Society for the Study of Human Biology and the British Society for Research in Ageing held a joint symposium in 1984 to consider human ageing and longevity from an interdisciplinary point of view The resulting book has four main sections the evolution and genetics of ageing biological age assessment demographic and social aspects and the nutritional and physiological aspects of ageing and longevity The fundamental nature of the subject will generate interest across a wide range of biological and medical disciplines [The Biology of Human Aging](#) Leonard Hayflick, 1980 **The Biology of Human Ageing** Alan Holland Bittles, Kenneth John Collins, 1986 **Biology of Aging** Alvaro Macieira-Coelho, 2002-10-21 The survival of the human species has improved significantly in modern times During the last century the mean survival of human populations in developed countries has increased more than during the preceding 5000 years This improvement in survival was accompanied by an increase in the number of active years In other words the increase in mean life span was accompanied by an increase in health span This is now accentuated by progress in medicine reducing the impact of physiologic events such as menopause and of pathological processes such as atherosclerosis Up to now research on aging whether theoretical or experimental has not contributed to improvement in human survival Actually there is a striking contrast between these significant modifications in survival and the present knowledge of the mechanisms of human aging Revealed by this state of affairs are the profound disagreements between gerontologists in regard to the way of looking at the aging process The definition of aging itself is difficult to begin with because of the variability of how it occurs in different organisms [The Cell Biology of Human Aging](#) Leonard Hayflick, 1980 **The Biology of Human Aging** John K. Hampton, Ruth F. Craven, Margaret M. Heitkemper, 1997 Presenting up to date information about the biology of human ageing this second edition of the text includes background biological material numerous illustrations and end of chapter review questions **Biology of Human Aging** Alexander P. Spence, 1995 Provides a general overview of the aging process and sufficient background on biological aspects **Time of Our Lives** Tom Kirkwood, 2001-01-11 By the year 2050 one in five of the world's population will be 65 or older a fact which presages profound medical biological philosophical and political changes in the coming century In *Time of Our Lives* Tom Kirkwood draws on more than twenty years of research to make sense of the evolution of aging to explain how aging occurs and to answer fundamental questions like why women live longer than men He shows that we age because our genes evolving at a time when life was nasty brutish and short placed little priority on the long term maintenance of our bodies With such knowledge along with new insights from genome research we can devise ways to target the root causes of aging

and of age related diseases such as Alzheimer's and osteoporosis. He even considers the possibility that human beings will someday have greatly extended life spans or even be free from senescence altogether. Beautifully written by one of the world's pioneering researchers into the science of aging, *Time of Our Lives* is a clear, original, and above all, inspiring investigation of a process all of us experience but few of us understand.

Biology of Aging Alvaro Macieira-Coelho, 2011-05-26 The survival of the human species has improved significantly in modern times. During the last century, the mean survival of human populations in developed countries has increased more than during the preceding 5000 years. This improvement in survival was accompanied by an increase in the number of active years. In other words, the increase in mean life span was accompanied by an increase in health span. This is now accentuated by progress in medicine reducing the impact of physiologic events such as menopause and of pathological processes such as atherosclerosis. Up to now, research on aging, whether theoretical or experimental, has not contributed to improvement in human survival. Actually, there is a striking contrast between these significant modifications in survival and the present knowledge of the mechanisms of human aging. Revealed by this state of affairs are the profound disagreements between gerontologists in regard to the way of looking at the aging process. The definition of aging itself is difficult to begin with because of the variability of how it occurs in different organisms.

Population Biology of Human Aging Oleg M. Pavlovsky, Eugene Kobylansky, 1997 **Biology of Aging** Roger B. McDonald, 2019-06-07 *Biology of Aging*, Second Edition, presents the biological principles that have led to a new understanding of the causes of aging and describes how these basic principles help one to understand the human experience of biological aging, longevity, and age-related disease. Intended for undergraduate biology students, it describes how the rate of biological aging is measured, explores the mechanisms underlying cellular aging, discusses the genetic pathways that affect longevity in various organisms, outlines the normal age-related changes and the functional decline that occurs in physiological systems over the lifespan, and considers the implications of modulating the rate of aging and longevity. The book also includes end-of-chapter discussion questions to help students assess their knowledge of the material. Roger McDonald received his Ph.D. from the University of Southern California and is Professor Emeritus in the Department of Nutrition at the University of California, Davis. Dr. McDonald's research focused on mechanisms of cellular aging and the interaction between nutrition and aging. His research addressed two key topics in the field: the relationship between dietary restriction and lifespan, and the effect of aging on circadian rhythms and hypothalamic regulation. and the Social Sciences The book is organized into two parts Part 1 covers basic aging processes It covers concepts relevant to clinical research such as muscle adipose tissue and stem cells It discusses research on how dietary restriction can slow down the aging process and extend life in a wide range of species Part 2 deals with the medical physiology of aging It contains several chapters on the aging of the human brain These chapters deal not only with diseases but also with normal aging changes to cerebral vasculature and myelination as well as the clinical implications of those changes Additional chapters cover how aging affects central features of human health such as insulin secretion pulmonary and cardiac function and the ability to maintain body weight and body temperature The volume is primarily directed at basic researchers who wish to keep abreast of new research outside their own subdiscipline It will also be useful to medical behavioral and social gerontologists who want to learn about the discoveries of basic scientists and clinicians Contains basic aging processes as determined by animal research as well as medical physiology of aging as known in humans Covers hot areas of research like stem cells integrated with longstanding areas of interest in aging like telomeres mitochondrial function etc Edited by one of the fathers of gerontology Masoro and contributors represent top scholars in gerontology

Handbook of Models for Human Aging P. Michael Conn, 2011-04-28 The Handbook of Models for Human Aging is designed as the only comprehensive work available that covers the diversity of aging models currently available For each animal model it presents key aspects of biology nutrition factors affecting life span methods of age determination use in research and disadvantages advantages of use Chapters on comparative models take a broad sweep of age related diseases from Alzheimer's to joint disease cataracts cancer and obesity In addition there is an historical overview and discussion of model availability key methods and ethical issues Utilizes a multidisciplinary approach Shows tricks and approaches not available in primary publications First volume of its kind to combine both methods of study for human aging and animal models Over 200 illustrations

Biomarkers of Human Aging Alexey Moskalev, 2019-09-13 This book collects and reviews for the first time a wide range of advances in the area of human aging biomarkers This accumulated data allows researchers to assess the rate of aging processes in various organs and systems and to individually monitor the effectiveness of therapies intended to slow aging In an introductory chapter the editor defines biomarkers of aging as molecular cellular and physiological parameters that demonstrate reproducible changes quantitative or qualitative with age The introduction recounts a study which aimed to create a universal model of biological age whose most predictive parameters were albumin and alkaline phosphatase indication liver function glucose metabolic syndrome erythrocytes respiratory function and urea renal function The book goes on to describe DNA methylation known as the epigenetic clock as currently the most comprehensive predictor of total mortality It is also useful for predicting mortality from cancer and cardiovascular diseases and for analyzing the effects of lifestyle factors including diet exercise and education Individual contributions draw additional insight from research on genetics and epigenetic aging markers and immunosenescence and inflammaging markers A concluding chapter outlines the
